Shapes Loops Images:

Solar Image Analysis and Visualization Jack Ireland, C. Alex Young, 2009-08-27 The SECCHI A and B instrument suites Howard et al 2006 onboard the two STEREO mission spacecraft Kaiser 2005 are each composed of one Extreme Ultra Violet Imager EUVI two white light coronagraphs COR1 and COR2 and two wide angle heliospheric imagers HI1 and HI2 Technical descriptions of EUVI COR1 and the HIs can be found in Wuelser et al 2004 Thompson et al 2003 and De se et al 2003 respectively The images produced by SECCHI represent a data visualization challenge i the images are 2048 2048 pixels except for the HIs which are usually binned onboard 2 2 thus the vast majority of computer displays are not able to display them at full frame and full resolution and ii more importantly the ve instruments of SECCHI A and B were designed to be able to track Coronal Mass Ejections from their onset with EUVI to their propagation in the heliosphere with the HIs which implies that a set of SECCHI images that covers the propagation of a CME from its initiation site to the Earth is composed of images with very different spatial resolutions from 1 7 arcsecondspixel for EUVI to 2 15 1 arcminutespixel for HI2 i e 75 times larger A similar situation exists with the angular scales of the physical objects since the size of a CME varies by orders of magnitude as it expands in the heliosphere

Multiresolution Image Shape Description John M. Gauch, 2012-12-06 Much of our understanding of the relationships among geometric structures in images is based on the shape of these structures and their relative orientations positions and sizes Thus developing quantitative methods for capturing shape information from digital images is an important area for computer vision research This book describes the theory implementation and application of two multi resolution image shape description methods The author begins by motivating the need for quantitative methods for describing both the spatial and intensity variations of structures in grey scale images Two new methods which capture this information are then developed The first the intensity axis of symmetry is a collection of branching and bending surfaces which correspond to the skeleton of the image The second method multiresolution vertex curves focuses on surface curvature properties as the image is blurred by a sequence of Gaussian filters Implementation techniques for these image shape descriptions are described in detail Surface functionals are minimized subject to symmetry constraints to obtain the intensity axis of symmetry Robust numerical methods are developed for calculating and following vertex curves through scale space Finally the author demonstrates how grey scale images can be segmented into geometrically coherent regions using these shape description techniques Building quantitative analysis applications in terms of these visually sensible image regions promises to be an exciting area of biomedical computer vision research v Acknowledgments This book is a corrected and revised version of the author's Ph D
