Point and Extended Defects in Semiconductors Giorgio Benedek, 2013-06-29

The systematic study of defects in semiconductors began in the early fifties. From that time on many questions about the defect structure and properties have been answered but many others are still a matter of investigation and discussion. Moreover during these years new problems arose in connection with the identification and characterization of defects, their role in determining transport and optical properties of semiconductor materials and devices as well as from the technology of the ever increasing scale of integration. This book presents to the reader a view into both basic concepts of defect physics and recent developments of high resolution experimental techniques. The book does not aim at an exhaustive presentation of modern defect physics rather it gathers a number of topics which represent the present time research in this field. The volume collects the contributions to the Advanced Research Workshop Point Extended and Surface Defects in Semiconductors held at the Ettore Majorana Centre at Erice Italy from 2 to 7 November 1988 in the framework of the International School of Materials Science and Technology. The workshop has brought together scientists from thirteen countries. Most participants are currently working on defect problems in either silicon submicron technology or in quantum wells and superlattices where point defects, dislocations, interfaces and surfaces are closely packed together.

Evaluation of Advanced Semiconductor Materials by Electron Microscopy David Cherns, 2012-12-06

The last few years have seen rapid improvements in semiconductor growth techniques which have produced an expanding range of high quality heterostructures for new semiconductor devices. As the dimensions of such structures approach the nanometer level it becomes increasingly important to characterise materials properties such as composition, uniformity, strain, interface sharpness and roughness and the nature of defects as well as their influence on electrical and optical properties. Much of this information is being obtained by electron microscopy and this is also an area of rapid progress. There have been advances for thin film studies across a wide range of techniques including for example convergent beam electron diffraction, X ray and electron energy loss microanalysis and high spatial resolution cathodoluminescence as well as by conventional and high resolution methods. Important developments have also occurred in the study of surfaces and film growth phenomena by both microscopy and diffraction techniques. With these developments in mind an application was made to the NATO Science Committee in late summer 1987 to fund an Advanced Research Workshop to review the electron microscopy of advanced semiconductors. This was subsequently accepted for the 1988 programme and became the NATO Advanced Research Workshop on the Evaluation of Advanced Semiconductor Materials by Electron Microscopy. The Workshop took place in the pleasant and intimate surroundings of Wills Hall Bristol UK during the week 11-17 September 1988 and was attended by fifty five participants from fourteen countries.
