Laylin, 1993-10-30 Through new perspectives from a mix of original monographs biographies autobiographical memoirs edited collections of essays and documentary sources translations classic reprints and pictorial volumes this series will document the individuals ideas institutions and innovations that have created the modern chemical sciences [Making 20th Century Science](#) Stephen G. Brush, Ariel Segal, 2015 Historically the scientific method has been said to require proposing a theory making a prediction of something not already known testing the prediction and giving up the theory or substantially changing it if it fails the test A theory that leads to several successful predictions is more likely to be accepted than one that only explains what is already known but not understood This process is widely treated as the conventional method of achieving scientific progress and was used throughout the twentieth century as the standard route to discovery and experimentation But does science really work this way In *Making 20th Century Science* Stephen G Brush discusses this question as it relates to the development of science throughout the last century Answering this question requires both a philosophically and historically scientific approach and Brush blends the two in order to take a close look at how scientific methodology has developed Several cases from the history of modern physical and biological science are examined including Mendeleev's Periodic Law Kekule's structure for benzene the light quantum hypothesis quantum mechanics chromosome theory and natural selection In general it is found that theories are accepted for a combination of successful predictions and better explanations of old facts *Making 20th Century Science* is a large scale historical look at the implementation of the scientific method and how scientific theories come to be accepted **The Planetary Scientist's Companion** Katharina Lodders, Bruce Fegley Jr., 1998-12-10 Scientists have collected a wealth of physical and chemical data for the Sun planets and small bodies in our solar system but until now this information has been scattered throughout the technical literature *The Planetary Scientist's Companion* solves this problem providing for the first time a single extensive reference for the interdisciplinary fields of planetary science and cosmochemistry The book begins with a summary of frequently used physical and chemical constants unit conversion factors properties of some compounds and minerals thermodynamic data partition coefficients and useful formulas This is followed by an overview of the solar system including comparative data for the planets and their satellites and abundances of the elements Much of the book is devoted to a series of chapters describing in turn the Sun each of the planets and the groups of small bodies asteroids comets meteorites and Kuiper Belt and Centaur objects Each chapter includes an introduction followed by tables of physical and chemical properties compiled from many

sources including data on planetary atmospheres surfaces and interiors The book concludes with data on nearby stars the interstellar medium and recently discovered brown dwarfs and possible extrasolar planets followed by a glossary A unique and practical resource for anyone interested in contemporary planetary science and cosmochemistry this volume is likely to be an essential tool in future research
