Lp On The Edge:

Algorithms on Strings, Trees, and Sequences Dan Gusfield, 1997-05-28 String algorithms are a traditional area of study in computer science. In recent years their importance has grown dramatically with the huge increase of electronically stored text and of molecular sequence data. DNA or protein sequences produced by various genome projects. This book is a general text on computer algorithms for string processing. In addition to pure computer science the book contains extensive discussions on biological problems that are cast as string problems and on methods developed to solve them. It emphasises the fundamental ideas and techniques central to today's applications. New approaches to this complex material simplify methods that up to now have been for the specialist alone. With over 400 exercises to reinforce the material and develop additional topics the book is suitable as a text for graduate or advanced undergraduate students in computer science, computational biology or bioinformatics. Its discussion of current algorithms and techniques also makes it a reference for professionals.

Understanding and Using Linear Programming Jiri Matousek, Bernd Gärtner, 2007-07-04 This is an introductory textbook of linear programming written mainly for students of computer science and mathematics Our guiding phrase is what every theoretical computer scientist should know about linear programming The book is relatively concise in order to allow the reader to focus on the basic ideas For a number of topics commonly appearing in thicker books on the subject we were seriously tempted to add them to the main text but we decided to present them only very briefly in a separate glossary At the same time we aim at covering the main results with complete proofs and in sufficient detail in a way ready for presentation in class One of the main focuses is applications of linear programming both in practice and in theory Linear programming has become an extremely useful tool in theoretical computer science and in mathematics While many of the newest modern applications are much too complicated to be included in an introductory text we hope to communicate some of the flavor and excitement of such applications on simpler examples

answer d the given info allows you to determine the speed of the wave $v = \frac{d}{t} = \frac{2 \text{ m}}{0.5 \text{ s}} = 4 \text{ m/s}$ if there are 3 waves in a 2 meter long rope then each wave is $\frac{2}{3}$ meter long now find frequency with the equation $v = f \lambda$ where $v = 4 \text{ m/s}$ and $\lambda = 0.667 \text{ m}$
