one of the state's favorite illustrators Hawk Ridge is as fun as it is informative. It introduces the state's raptors from the rare visitor to the most familiar hawk, noting each species' signature traits: osprey wings for instance are crooked to help them catch fish; vultures urinate on their legs to cool themselves; and their nesting, breeding, and migrating habits. Did you know that Sharp-shinned Hawks banded at Hawk Ridge have been found throughout Central America and even into South America and also in midwinter in Wisconsin? Laura Erickson offers a broad perspective, a bird's-eye view making sense of the raptor's role in the larger ornithological scheme. With descriptions of various species and helpful distinctions between species, families, and orders, the book gives readers a clear idea of which raptors might be seen in Minnesota, when, where, and how often. It also includes a hawk migration primer that explains the movements that bring these birds in such awe-inspiring numbers to places like Hawk Ridge. Filled with curious facts and practical information for expert and amateur bird watcher alike, the book is at once a guide to the hawks of Minnesota and a beautifully illustrated album of the most regal members of the avian kingdom.

**Introduction to Modeling for Biosciences** David J. Barnes, Dominique Chu, 2010-07-23. Mathematical modeling can be a useful tool for researchers in the biological sciences. Yet in biological modeling, there is no one modeling technique that is suitable for all problems. Instead, different problems call for different approaches. Furthermore, it can be helpful to analyze the same system using a variety of approaches to be able to exploit the advantages and drawbacks of each. In practice, it is often unclear which modeling approaches will be most suitable for a particular biological question, a problem which requires researchers to know a reasonable amount about a number of techniques rather than become experts on a single one. *Introduction to Modeling for Biosciences* addresses this issue by presenting a broad overview of the most important techniques used to model biological systems. In addition to providing an introduction into the use of a wide range of software tools and modeling environments, this helpful text/reference describes the constraints and difficulties that each modeling technique presents in practice, enabling the researcher to quickly determine which software package would be most useful for their particular problem. *Topics and Features* introduces a basic array of techniques to formulate models of biological systems and to solve them; intersperses the text with exercises; throughout the book includes practical introductions to the Maxima computer algebra system, the PRISM model checker, and the Repast Simphony agent modeling environment; discusses agent-based models, stochastic modeling techniques, differential equations, and Gillespie's stochastic simulation algorithm; contains appendices on Repast batch running, rules of differentiation and integration, Maxima and PRISM notation, and some additional mathematical concepts; supplies source code for many of the example models discussed at the associated website <http://www.cs.kent.ac.uk/imb>. This unique and practical guide leads the novice modeler through realistic and concrete modeling projects, highlighting and commenting on the process of abstracting the real system into a model. Students and active researchers in the biosciences will also benefit from the discussions of the high-quality, tried and tested modeling tools described in the book. Dr David J. Barnes is a lecturer in computer science at the University of Kent, UK.

with a strong background in the teaching of programming Dr Dominique Chu is a lecturer in computer science at the University of Kent UK He is an internationally recognized expert in agent based modeling and has also in depth research experience in stochastic and differential equation based modeling
