Project II*, 1980 A catalog has been prepared which contains information for 1 world wide ground motion accelerograms 2 the accelerograph sites where these records were obtained and 3 the seismological parameters of the causative earthquakes The catalog is limited to data for those accelerograms which have been digitized and published In addition the quality and completeness of these data are assessed This catalog is unique because it is the only publication which contains comprehensive information on the recording conditions of all known digitized accelerograms However information for many accelerograms is missing Although some literature may have been overlooked most of the missing data has not been published Nevertheless the catalog provides a convenient reference and useful tool for earthquake engineering research and applications      **The Las Vegas Valley Seismic Response Project**, 2005 Between 2001 2004 the Las Vegas Seismic Response Project has sought to understand the response of Las Vegas Valley LVV to seismic excitation In this study the author report the findings of this project with an emphasis on ground motions in LVV from nuclear explosions at the Nevada Test Site NTS These ground motions are used to understand building structural response and damage as well as human perception Historical nuclear explosion observations are augmented with earthquake recordings from a temporary deployment of seismometers to improve spatial coverage of LVV The nuclear explosions were conducted between 1968 and 1989 and were recorded at various sites within Las Vegas The data from past nuclear tests were used to constrain ground motions in LVV and to gain a predictive capability of ground motions for possible future nuclear tests at NTS Analysis of ground motion data includes peak ground motions accelerations and velocities and amplification of basin sites relative to hard rock sites site response Site response was measured with the Standard Spectral Ratios SSR technique relative to hard rock reference sites on the periphery of LVV The site response curves indicate a strong basin amplification of up to a factor of ten at frequencies between 0.5 2 Hz Amplifications are strongest in the central and northern portions of LVV where the basin is deeper than 1 km based on the reported basin depths of Langenheim et al 2001a They found a strong correlation between amplification and basin depth and shallow shear wave velocities Amplification below 1 Hz is strongly controlled by slowness averaged shear velocities to depths of 30 and 100 meters Depth averaged shear velocities to 10 meters has modest control of amplifications between 1 3 Hz Modeling reveals that low velocity material in the shallow layers      *Compilation, Assessment and Expansion of the Strong Earthquake Ground Motion Data Base*, 1980      **Earthquakes and Associated Topics in Relation to Nuclear Power Plant Siting** International Atomic Energy Agency, 1991      *Strong Ground Motion Seismology* Mustafa Erdik, M.
