ABSTRACT

Science and Technology Studies (STS) is one of a number of new research fields to emerge over the last four or five decades. This paper attempts to identify its core academic contributions from the perspective of the authors of chapters in authoritative ‘handbooks’ and the references they cite. Besides identifying the most prominent publications, institutions and authors, we examine whether the core contributions can be broken down into identifiable clusters. The study also analyses the impact of these contributions by exploring the research fields, journals, and geographical location of the researchers that have cited the STS core contributions in their own work. Together, these analyses reveal a number of phases in the development of STS with periods of convergence and divergence of the field, including the gradual separation of quantitative studies of science and technology from the main body of STS. The paper ends with some conclusions about the evolution of STS, such as the role of ‘institution builders’ in developing new research fields and the structures required to hold them together.

1. Introduction

New research fields in the social and natural sciences often originate at the intersections of established disciplines when researchers from neighbouring disciplines, with differing disciplinary perspectives, realise they share a common interest. Over time, by working together, they may start to develop their own shared conceptual, methodological and analytical frameworks. This then allows them to move from publishing in journals of their ‘parent’ disciplines and to establish their own journals, professional associations, specialised university departments or units (often with the name of the new field in their title), and PhD programmes to train their own researchers. Eventually, some fields may acquire enough of these characteristics in sufficiently developed form to achieve ‘disciplinary’ status.

This process of convergence can be seen in the field of Innovation Studies (which previously went by other titles such as ‘Science Policy’ – see Fagerberg and Verspagen, 2009; Fagerberg et al., 2012; Martin, 2012) and Entrepreneurship (Landström et al., 2012). However, as this paper will show, convergence is not the only possible outcome. The field of Science and Technology Studies (STS¹), the

subject of this paper, has shown elements of both **convergence and divergence** since it began to emerge as a distinct organised speciality in the 1960s.

From a science policy perspective, such convergence and divergence have both positive and negative consequences. The shared assumptions of a discipline increase the coherence and speed of distributed problem-solving (Turro, 1986), but can also lead to group-think and intellectual inbreeding (Rafols et al., 2012).² Disciplines allow researchers to refrain from constantly justifying their implicit assumptions and judgements about research quality standards; they allow standardisation (for example, in terms of methodology); and they generate the scale needed to justify high fixed-cost investments in data collection, instrumentation and career development. **However, disciplinary cognitive framings can also blind researchers to alternative perspectives;** disciplinary power structures can adversely influence resource allocation, academic promotions and research evaluation; and cognitive infrastructure can embed flawed assumptions in path-dependent research trajectories from which it is difficult to escape.

The process of moving from a research field of shared interest to disciplinary status is generally punctuated by the publication of **a series of connected core contributions** that act as models, or

its title), although since then some authors have made a distinction between the two.

² These conflicting interactions are why ground-breaking research is often interdisciplinary, although interdisciplinary research is often not ground-breaking.

¹ Somewhat confusingly, STS is also used as an abbreviation for ‘Science, Technology and Society’. During the early decades at least, these two terms were used interchangeably (the 1977 STS Handbook uses ‘Science, Technology and Society’ in

Do Glaciers Listen? Julie Cruikshank, 2010-10-01 Do Glaciers Listen explores the conflicting depictions of glaciers to show how natural and cultural histories are objectively entangled in the Mount Saint Elias ranges This rugged area where Alaska British Columbia and the Yukon Territory now meet underwent significant geophysical change in the late eighteenth and nineteenth centuries which coincided with dramatic social upheaval resulting from European exploration and increased travel and trade among Aboriginal peoples European visitors brought with them varying conceptions of nature as sublime as spiritual or as a resource for human progress They saw glaciers as inanimate subject to empirical investigation and measurement Aboriginal oral histories conversely described glaciers as sentient animate and quick to respond to human behaviour In each case however the experiences and ideas surrounding glaciers were incorporated into interpretations of social relations Focusing on these contrasting views during the late stages of the Little Ice Age 1550 1900 Cruikshank demonstrates how local knowledge is produced rather than discovered through colonial encounters and how it often conjoins social and biophysical processes She then traces how the divergent views weave through contemporary debates about cultural meanings as well as current discussions about protected areas parks and the new World Heritage site Readers interested in anthropology and Native and northern studies will find this a fascinating read and a rich addition to circumpolar literature

Research and Relevant Knowledge

Roger L. Geiger, 2017-09-29 The rise of American research universities to international preeminence constitutes one of the most important episodes in the history of higher education Research and Relevant Knowledge follows Geiger's earlier volume on American research universities from 1900 to 1940 This second work is the first study to trace this momentous development in the post World War II period It describes how the federal government first relied on university scientists during the war and how the resulting relationship set the pattern for the postwar mushrooming of academic research The first half of the book analyzes the development of the postwar system of academic research exploring the contributions of foundations defense agencies and universities The second half depicts the rise of the golden age of academic research in the years after Sputnik 1957 and its eventual dissolution at the end of the 1960s graduate education When the federal patron soon reduced its largesse university students took the lead in challenging the putative hegemony of academic research The loss of consensus quickly brought the malaise of the 1970s stagnation frustration and equivocation about the research role The final chapter appraises the renaissance of the 1980s based largely on a rapprochement with the private sector and ends by evaluating the embattled status of research universities at the beginning of the 1990s Research and Relevant Knowledge provides the first authoritative analytical account of American research universities during their most fateful half century It will be of critical importance to all those concerned with the future of higher education in the United States

Knowledge, Power, and Participation in Environmental Policy Analysis Rob Hoppe, 2018-01-16 This volume probes practical dilemmas and competing research perspectives in environmental policy analysis Scholars working in different fields research traditions societies and policy domains offer significant insights into the processes and consequences of environmental policy making Part 1 Coping with Boundaries describes present day conflict between experts and greater public participation in environmental policy It shows that the institutionalization of increasingly complex environmental problems has led to a conflict between technocracy and democracy Part 2 The Transnational Challenge examines modes of cooperation between grassroots movements scientists and regional authorities in the United States and Canada These and other modes of cooperation laid the foundations for the Great Lakes Water Quality Agreement increased the effectiveness of air pollution treaties and increased climate change Part 3 Bio Hazards Policies and Paralysis deals with environmental problems closest to the everyday concerns of the public at large because they have immediate implications for food safety and other values Part 4 The Citizens Perspective focuses on citizen vis a vis environmental policy noting that in order to make policies work citizens must be willing and able to participate in policy making and cooperate in

implementing environmental choices Part 5 Confronting Ordinary and Expert Knowledge explores opportunities and constraints affecting public participation in evaluation of science Part 6 Developments in Research Programming addresses such questions as whether scientists still have opportunities to do the research they want without being interrupted or disturbed by policy makers and other stakeholders Part 7 Policy Sciences Aspirations explores different avenues for improving environmental policy Volume twelve in the PSRA series should inspire further investigations of the relations among knowledge power and participation in environmental policy It will be of timely interest to environmentalists policy makers scholars and the general public
