Jonathan A. Holmes

Gansser, A. 1964: *Geology of the Himalayas*. London: Wiley.

Sloggett, D.R. 1989: *Satellite Data: Processing, Archiving and Dissemination*. Volume 1, *Applications and infrastructure*. Volume 2, *Functions, operational principles and design*. Chichester: Ellis Horwood. Vol.1, 180 pp. £35.00 cloth. Vol.2, 296 pp. £39.95 cloth.

These volumes focus on the infrastructure handling the acquisition, processing and dissemination of satellite data and are a unique attempt to bring to the attention of satellite data users some of the complexity inherent in the provision of these data. Much of this complexity occurs 'behind the scenes' to most physical geography users of remotely sensed data, but there is much to be said for users becoming more acquainted with the technical aspects involved in making the data available to them. The scope of these volumes goes beyond earth remote sensing, and considers the use of satellite data in disciplines such as astronomy and solar terrestrial physics. The author envisages a move to operational use of satellite data in the next decade. To accommodate this fundamental change, he suggests that a new infrastructure for ground segment activities is needed. These volumes outline the details of such an infrastructure and reviews those set up for earlier satellite missions. The volumes are aimed at a wide range of readers, considering the specific nature of the subject matter. The primary readership must be those directly involved with designing ground segment infrastructure. Research scientists and commercial users of satellite data, although targeted as potential readers, are likely to find the contents unnecessarily detailed in places, although there is much of interest. Volume 1 is split into three chapters. Chapter 1 looks at five different application areas of satellite data: meteorology, remote sensing, astronomy, solar terrestrial physics and microgravity; and contains a wealth of information on past, present and future satellite missions. Chapter 2 reviews the design and operation of the space segment. This material is an important precursor to the consideration of the role of the ground segment, dealt with in Chapter 3, which provides an introduction to material covered in more detail in volume 2. The author introduces a confusing dichotomy between remote sensing and meteorological satellites. Remote sensing here appears to be confined to earth surface observation, and precludes atmospheric remote sensing. Most definitions of remote sensing do not recognize this division (see for example, Harris, 1987; Mather, 1987), and the author needs to define these terms at the outset, if he is to use nonstandard definitions. However, a much more useful division is made between real time data users (such as meteorologists, where data must be available within three hours of collection) and nonreal time users (such as most earth observation programmes, where a gap of several weeks can be tolerated).
