Low Flow Anaesthesia:

Low Flow Anaesthesia Jan A. Baum, Geoffrey Nunn, 1996 In recent years methods of anaesthesia with reduced fresh gas flows and closed rebreathing systems have been viewed with increasing interest However as a great many anaesthetists are not familiar with the techniques of Low Flow Minimal Flow and Closed System anaesthesia some concerns have been expressed about their use Although this alternative approach to anaesthesia may call for a reappraisal of current practice the advantage of economies in the use of gases tightened occupational safety regulations as well as environmental considerations provide compelling reasons for an exploration of these methods Low Flow Anaesthesia the Theory and Practice of Low Flow Minimal Flow and Closed System Anaesthesia is one of the few monographs providing a comprehensive overview of the subject After an initial discussion of theoretical fundamentals the author proceeds to a detailed appraisal of problems arising in clinical practice Different types of modern anaesthetic machines and monitoring systems are examined in detail and the text is rounded off by a look at future developments in the field Originally published in German this updated English edition has been revised in collaboration with a well respected UK consultant anaesthetist and should prove essential reading for all anaesthetists both in training and in practice

Cost Analysis in Applying Low Flow Anesthesia Techniques Brien Macon, 2021 In the world of health care we have continued to struggle to find a balance in cost and practical usage of resources Anesthetic gases serve as an integral part of the surgical procedure and are administered to multiple patient populations Of the anesthetic gases being utilized none is more currently prevalent than sevoflurane Sevoflurane is a more costly agent and is often administered at a fresh gas flow rate of two or greater to avoid the development of compound A toxicity Providers should be aware of the capability to prevent the development of the toxic agent while simultaneously providing care at a more cost effective level to both the patient and the medical institution through lower fresh gas flows given the proper equipment This project analyzes the financial comparison of applying low fresh gas flow LFGF to the widely used setting of high fresh gas flow standard fresh gas flow and showcases the economic benefits the former will bring to the health care system Data was collected from a level one medical institution that has the capability to run low fresh gas flow due to the absorbent Amsorb Plus A comparison between low fresh gas flow and traditional standard flow rates was conducted Two groups of anesthesia providers were formed one only using low fresh gas flow rates and the other using flow rates equal to or greater than two The results showcased an overall 49% decline in cost to the medical facility if low fresh gas flow rates were more commonly utilized Annually anesthesia providers on average cost the facility around 3 300 per person by using flow rates equal to or greater than two In the application of low flow rates providers on average annually cost the facility 1 850 Obtaining these results revealed the huge margin of savings that could be achieved in applying lower flow rates The medical facility would gain savings by implementing resources that already exist to deliver low flow anesthesia with Sevoflurane safely and cost effectively Abstract , *Understanding Anesthetic Equipment & Procedures* Dwarkadas K
