Re-engineering of Products and Processes Federico Rotini, Yuri Borgianni, Gaetano Cascini, 2012-04-23 Whilst previous methods for business process reengineering have focused on time and cost reduction policies to preserve competitive services and products Re engineering of Products and Processes How to Achieve Global Success in the Changing Marketplace presents a new approach which aims to include aspects that impact the customer perceived value This method supports business reengineering initiatives by identifying process bottlenecks as well as new products and services viable to overcome market competition This original approach is described step by step explaining the theory through examples of performable tasks and the selection of relevant tools according to the nature of the problem Supported by illustrations tables and diagrams Re engineering of Products and Processes How to Achieve Global Success in the Changing Marketplace clearly explains a method which is then applied to several case studies across different industrial sectors Re engineering of Products and Processes How to Achieve Global Success in the Changing Marketplace provides a scientific reference for researchers and PhD students working in several fields of the Industrial Engineering mechanical electric electronic sectors and more in general all the industrial areas where there are needs to design innovative products The step by step description on how to employ the proposed method and its application to practical examples make the book a key resource for industry consultants and managers who look to increase the value of their products and services for new and existing customers

Design and Management of Manufacturing Systems Arkadiusz Gola, 2021-09-02 Although the design and management of manufacturing systems have been explored in the literature for many years now they still remain topical problems in the current scientific research The changing market trends globalization the constant pressure to reduce production costs and technical and technological progress make it necessary to search for new manufacturing methods and ways of organizing them and to modify manufacturing system design paradigms This book presents current research in different areas connected with the design and management of manufacturing systems and covers such subject areas as methods supporting the design of manufacturing systems methods of improving maintenance processes in companies the design and improvement of manufacturing processes the control of production processes in modern manufacturing systems production methods and techniques used in modern manufacturing systems and environmental aspects of production and their impact on the design and management of manufacturing systems The wide range of research findings reported in this book confirms that the design of manufacturing systems is a complex problem and that the achievement of goals set for modern manufacturing systems requires interdisciplinary knowledge and the simultaneous design of the product process and system

as well as the knowledge of modern manufacturing and organizational methods and techniques **Computer Applications in Production and Engineering** Frank Plonka, Gustav J. Olling, 2013-06-05 In the latter half of the 20th century forces have conspired to make the human community at last global The easing of tensions between major nations the expansion of trade to worldwide markets widespread travel and cultural exchange pervasive high speed communications and automation the explosion of knowledge the streamlining of business and the adoption of flexible methods have changed the face of manufacturing itself and of research and education in manufacturing The acceptance of the continuous improvement process as a means for organizations to respond quickly and effectively to swings in the global market has led to the demand for individuals educated in a broad range of cultural organizational and technical fields and capable of absorbing and adapting required knowledge and training throughout their careers No longer will manufacturing research and education focus on an industrial sector or follow a national trend but rather will aim at enabling international teams of companies to cooperate in rapidly designing prototyping and manufacturing products The successful enterprise of the 21st century will be characterized by an organizational structure that efficiently responds to customer demands and changing global circumstances a corporate culture that empowers employees at all levels and encourages constant communication among related groups and a technological infrastructure that fully supports process improvement and integration In changing itself to keep abreast of the broader transformation in manufacturing the enterprise must look first at its organization and culture and thereafter at supporting technologies *E-Business and Virtual Enterprises* Luis M. Camarinha-Matos, Hamideh Afsarmanesh, Ricardo J. Rabelo, 2013-06-29 The fast progress in computer networks and their wide availability complemented with on one hand the explosion of the mobile computing and on the other hand the trends in the direction of ubiquitous computing act as powerful enablers for new forms of highly dynamic collaborative organizations and emergence of new business practices The first efforts in virtual enterprises VE were strongly constrained by the need to design and develop horizontal infrastructures aimed at supporting the basic collaboration needs of consortia of enterprises Even pilot projects that were focused on specific business domains were forced to first develop some basic infrastructures before being able to develop their specific business models Nowadays although there is still a need to consolidate and standardize the horizontal infrastructures the focus is more and more directed to the development of new vertical business models and the corresponding support tools At the same time in the earlier R D projects the attention was almost exclusively devoted to the operation phase of the VE life cycle while now there are more activities addressing the creation phase developing mechanisms to support the rapid formation of new virtual organizations for new business opportunities In order to complete the life cycle there is a need to also invest on support for VE dissolution Computer-Assisted Management and Control of Manufacturing Systems Spyros G. Tzafestas, 2012-12-06 Modern manufacturing systems involve many processes and operations that can be monitored and controlled at several levels of intelligence At the highest level there is a computer that supervises the various manufacturing

functions whereas at the lowest level there are stand alone computer controlled systems of manufacturing processes and robotic cells Until recently computer aided manufacturing systems constituted isolated islands of automation each oriented to a particular application but present day systems offer integrated approaches to manufacturing and enterprise operations These modern systems known as computer integrated manufacturing CIM systems can easily meet the current performance and manufacturing competitiveness requirements under strong environmental changes CIM systems are much of a challenge and imply a systemic approach to the design and operation of a manufacturing enterprise Actually a CIM system must take into account in a unified way the following three views the user view the technology view and the enterprise view This means that CIM includes both the engineering and enterprise planning and control activities as well as the information flow activities across all the stages of the system

Handbook of Cellular Manufacturing Systems Shahrukh A. Irani, 1999-04-15

Cellular manufacturing CM is the grouping of similar products for manufacture in discrete multi machine cells It has been proven to yield faster production cycles lower in process inventory levels and enhanced product quality Pioneered on a large scale by Russian British and German manufacturers interest in CM methods has grown steadily over the past decade However there continues to be a dearth of practical guides for industrial engineers and production managers interested in implementing CM techniques in their plants Bringing together contributions by an international team of CM experts the Handbook of Cellular Manufacturing Systems bridges this gap in the engineering literature

Emerging Solutions for Future Manufacturing Systems Luis M. Camarinha-Matos, 2006-01-04 Industries and particularly the manufacturing sector have been facing difficult challenges in a context of socio economic turbulence characterized by complexity as well as the speed of change in causal interconnections in the socio economic environment In order to respond to these challenges companies are forced to seek new technological and organizational solutions In this context two main characteristics emerge as key properties of a modern automation system agility and distribution Agility because systems need not only to be flexible in order to adjust to a number of a priori defined scenarios but rather must cope with unpredictability Distribution in the sense that automation and business processes are becoming distributed and supported by collaborative networks Emerging Solutions for Future Manufacturing Systems includes the papers selected for the BASYS 04 conference which was held in Vienna Austria in September 2004 and sponsored by the International Federation for Information Processing IFIP
