Karipidis, 2020-07-24 Fluency is the quintessence of effective reading To obtain socio economic success fluent reading is of primordial importance and reading is considered a crucial marker of an individual s life course Approximately 5% of children are affected by developmental dyslexia exhibiting inaccurate word recognition spelling phonological decoding and most importantly severely dysfluent reading which remains as their most characterizing and persistent deficit Unable to attain society s literacy demands individuals with dyslexia are at severe risk for adverse academic economic and psychosocial consequences Recently it has been posed that the development of automatic letter speech sound LSS integration is critical in the acquisition of fluent reading skills and in particular that a failure to develop automatic LSS integration results in an impairment of reading fluency In support neurocognitive research has suggested that the development of automatized processing of LSS associations is an essential step in the formation of a functional neural network for reading Furthermore both neurocognitive and behavioural studies have suggested a less efficient LSS integration in children with dyslexia than in typical readers Finally results from intervention studies have suggested that training LSS might be a promising approach to ameliorate dysfluent reading in children with dyslexia Nonetheless there is still a considerable gap of knowledge in our understanding of

the mechanisms by which learning LSS associations relate to dysfluent reading      **Research in Education** ,1973

requires linguistic skills auditory skills and visual skills Oscillatory temporal sampling theory links the development of sensory and linguistic processes The auditory system samples acoustic information at different temporal rates which for speech processing suggests that temporal information encoded by delta theta and gamma oscillations is bound together in the final speech percept Temporal sampling theory proposed a possible deficit in dyslexia in auditory sampling of the speech signal at syllable relevant rates 10 Hz delta and theta This would hypothetically affect prosodic development prior to reading and syllable based parsing which would affect efficient linguistic skills and consequently reading development across languages The visual system also samples information in the visuo spatial field In theory atypical visual oscillatory sampling could therefore be related to some of the visual features of developmental dyslexia In this special issue we bring together visual and auditory sensory processing studies around the general theme of oscillatory temporal sampling Contributors were encouraged to discuss their findings within a temporal sampling perspective The resulting studies cover a wide range of sensory processes with findings both supporting and contradicting the theory It is also important to note that studies covered a wide range of languages and that the behavioural manifestations of a sampling impairment may differ both with language and over the course of development Nevertheless it is encouraging to see such diverse findings considered within a single theoretical framework even if at the same time it is apparent that an over arching theoretical framework encompassing both visual and auditory deficits in dyslexia is yet to be achieved      *Technical Information Pilot* ,1952      *The Language of*
