Managing Failed Anti-Reflux Therapy Mark K. Ferguson, M. Brian Fennerty, 2006-01-16 Although GERD was initially described in the early 19th century it is essentially a consequence of our modern day largesse Dietary factors and associated obesity have combined with as yet other unknown factors e.g. a decrease in the prevalence of H. pylori to make GERD one of the most common diseases affecting western society It is estimated that up to 20 million adults in the United States suffer from GERD and treatment of these individuals consumes approximately 10 billion annually the majority of it for prescription drugs used to manage the disease and its symptoms Fortunately despite challenges presented by co-factors resulting in GERD diet obesity etc therapy of GERD is largely successful However even a low failure rate for a therapy used in the management of GERD still results in large numbers of affected patients because of the high prevalence of this disease Use of a conservative estimate of a failure rate of 5% translates to 1 million ineffectively treated and unhappy patients How to manage these patients is the subject of this book Why is publication of this book important now Several factors prompted us to work on this project Mature results for proton pump inhibitor use are available making this an appropriate time to review outcomes of PPI therapy of GERD Similarly mature results are now available for minimally invasive surgical therapy for GERD
