Radwan, 2025-06-27 This Research Topic is Volume II of a series The previous volume can be found here Differences in Shale Oil and Gas Reservoirs across Various Sedimentary Environments Theories and Applications The remarkable success of shale oil and gas production in North America has sparked worldwide interest in its significance Notably substantial shale oil and gas reserves have been discovered in China's Cambrian and Ordovician Silurian shales which serve as the primary sources of production Across the Asian continent other shale plays exist with several countries such as India Saudi Arabia and Pakistan actively pursuing development plans to identify additional resources Globally exploration and development of shale oil and gas in marine continental transitional and

terrestrial formations have resulted in significant breakthroughs leading to the development of a host of geological theories and technologies for shale oil and gas extraction. With the availability of sophisticated exploration, drilling, logging, and advanced analysis and testing tools, in-depth investigation can be conducted on various aspects of shale formations, including the organic matter enrichment mechanism, sedimentation sequence, reservoir formation, oil and gas generation, drilling, and development. Additionally, the coexistence of similarities and differences in the characteristics of shale reservoirs formed in different sedimentary environments will undoubtedly impact the exploration and development of shale oil and gas. This Research Topic aims to bring together Original Research and Review articles addressing the similarities and differences of the geological theories of shale oil and gas in terrestrial, marine, and marine continental transitional formations, which facilitates an overview of the latest advancement in how these geological theories can be applied in major shale oil and gas basins worldwide. Potential themes include but are not limited to: Management of global shale oil and gas development; Fractures and faults in shale; Mechanisms of organic matter enrichment; Stratification and sedimentary characteristics of shale deposits; Quantitative characterization of shale reservoirs; Pore space characterization of shale reservoirs; Shale oil and gas preservation conditions; Reservoir formation mechanisms of shale oil and gas; Drilling and development of shale oil and gas in different facies; Tight gas reservoir formation and conversion; Variations in shale reservoir characteristics.

The Climate of Past Interglacials F. Sirocko, M. Claussen, T. Litt, M.F. Sanchez-Goni, 2006-12-08. Historically, climate fluctuations such as the Little Ice Age show that interglacial climate change is not entirely stable but responds to even subtle changes in radiative forcing. Through research, it has been made clear that even an abrupt change of climate within years is not just a theoretical possibility but has in fact happened in the prehistoric past. It is therefore clear that in principle it could happen again. Human civilization has exploded under the mild and relatively stable climatic conditions that have prevailed over the last 11 000 years. This book focuses on revisiting the past and to study climate and environment in a suite of experiments where boundary conditions are similar but not identical to today so we can learn about the climate environment system, its sensitivity thresholds, and feedback. The palaeoclimate community holds an important key to scientific information on climate change that provides a basis for appropriate adaptation and mitigation strategies. The authors of this book have taken up this challenge and summarize their results in this special volume. It presents state of the art science on new reconstructions from all spheres of the Earth System and on their synthesis on methodological advances and on the current ability of numerical models to simulate low and high frequency changes of climate environment and chemical cycling related to interglacials.

Winterwerp, C. Kranenburg,2002-06-05 Cohesive sediment or mud is encountered in most water bodies throughout the world Often mud is a valuable resource synonymous with fertile land enriching the natural environment and used as an important building material Yet mud also hinders navigation and consequently dredging operations have been carried out since ancient times to safeguard navigation Unfortunately many mud deposits are now contaminated endangering the ecosystem and increasing the costs of dredging operations The transport and fate of mud in the environment are still poorly understood and the need for basic research remains This text contains the proceedings of the INTERCOH 2000 conference on progress in cohesive sediment research It was the sixth in a series of conferences initially started by Professor Ashish Mehta in 1984 as a Workshop on Cohesive Sediment Dynamics with Special Reference to the Processes in Estuaries During these conferences the character of the first workshop has always been maintained that is small scale and dedicated to the physical and engineering aspects of cohesive sediments without parallel sessions but with ample time for discussions during and after the presentations and followed by a book of proceedings containing thoroughly reviewed papers INTERCOH 2000 was integrated with the final workshop of the COSINUS project This project was carried out as a part of the European MAST 3 programme and almost all European cohesive sediment workers were involved INTERCOH 2000 focused on the behaviour and modelling of concentrated benthic suspensions i.e. high concentrated near bed suspensions of cohesive sediment Special attention was paid to sediment turbulence interaction flocculation and settling velocity high concentrated mud suspensions processes in the bed consolidation processes on the bed erosion field observations on mud dynamics instrumentation and numerical
