evaluation of reliability measures 2 terminal all terminal k terminal reliability for systems whose structure can be described in the form of a probabilistic graph Among the several approaches of network reliability evaluation the multiple variable inversion sum of disjoint product approach finds a well deserved niche as it provides the reliability or unreliability expression in a most efficient and compact manner However it does require an efficiently enumerated minimal inputs minimal path spanning tree minimal k trees minimal cut minimal global cut minimal k cut depending on the desired reliability The present book covers these two aspects in detail through the descriptions of several algorithms devised by the reliability fraternity and explained through solved examples to obtain and evaluate 2 terminal k terminal and all terminal network reliability unreliability measures and could be its USP The accompanying web based supplementary information containing modifiable Matlab source code for the algorithms is another feature of this book A very concerted effort has been made to keep the book ideally suitable for first course or even for a novice stepping into the area of network reliability The mathematical treatment is kept as minimal as possible with an assumption on the readers side that they have basic knowledge in graph theory probabilities laws Boolean laws and set theory
