Climate Change in the Himalayas G. B. Pant, P. Pradeep Kumar, Jayashree V. Revadekar, Narendra Singh, 2017-09-15

This book analyzes the issues associated with climate change in the Himalayas. The purpose of choosing the Himalayas as a focus is because it is a particularly fragile mountain system highly sensitive to climate change impacts and it contains one of the largest human populations affected by climate change. The book provides extensive data and information regarding the climate history of the Himalayas and the current effects of climate change on Himalayan weather systems and on human and animal populations in the region. The book begins with an overview of global climate change with discussions of data trends and international initiatives, then segues into a history of climate changes and weather trends in the Himalayas. Weather systems of the Himalayas both past and current are analyzed and detailed through climate models, seasonal observations of weather fronts, and overviews of various climate scenarios. The book then discusses climate change impacts and signatures specific to the Central Himalayan region where the largest effects of impacts are observed. Readers will discover analysis presented on water resources, meteorological changes, biodiversity, agriculture, and human health, along with perspectives of management and policy. This book will appeal to researchers studying climate science, climatology, environmental scientists, and policymakers.

Global Climate Change Demystified James G. Speight, 2019-12-17

Tackling one of the most controversial subjects of our time, one of the world's foremost environmental and petroleum engineers explores the potential causes and ramifications of global climate change. For too many years, climate change, also referred to as global warming, has been assigned predominantly to the emissions of carbon dioxide through the combustion of fossil fuels. It must never be forgotten or ignored, however, that the Earth has been constantly changing since its formation and has gone through different eras like glaciations, among others. These changes need thousands of years to be made visible and are likely still continuing, given the increase in the average temperature of the Earth since the pre-industrial period. Provided that the measurements of past climatic temperatures are accurate and beyond reproach, it follows that the warming trend that has occurred over the past 100 years is very likely to have some origins in natural events as well as in human activity. The precise contributions of natural effects and anthropogenic effects on the climate are not known, but it is accurate to conclude that many factors continue to influence climate. Whether or not human activities have become a dominant force in the changing climate and are responsible for most of the warming observed is still open to question. When studying the climate system of the Earth, an area of common confusion is whether climate scientists agree or disagree as to whether or not climate change is happening or if it is happening, whether or not humans are the primary cause. There are a variety of reasons for this, but a majority of scientists who study climate and publish in peer-reviewed journals agree that human activity is causing the warming of the Earth. The purpose of this book is to weigh all of these various data points and in a scientific and unemotional way arrive at likely conclusions regarding global climate change. Whether human activity is the main driver behind our current changes in climate, one thing is certain: Climate change is happening, and we all need to make informed rather than emotional decisions.

Changing Climates, Earth Systems and Society John Dodson, 2010-09-02. The International Year of Planet Earth (IYPE) was established as a means of raising worldwide public and political awareness of the vast though frequently under used potential the Earth Sciences possess for improving the quality of life of the peoples of the world and safeguarding Earth's rich and diverse environments. The International Year project was jointly initiated in 2000 by the International Union of Geological Sciences (IUGS) and the Earth Science Division of the United Nations Educational, Scientific and Cultural Organisation (UNESCO). IUGS, which is a Non Governmental Organisation, and UNESCO, an Inter Governmental Organisation, already shared a long record of productive cooperation in the natural sciences and their application to societal problems, including the International Geoscience Programme (IGCP) now in its fourth decade. With its main goals of raising public awareness of and enhancing research in the Earth sciences on a global scale in both the developed and less developed countries of the world, two operational programmes were demanded. In 2002 and 2003 the Series Editors, together with Dr Ted Nield and Dr Henk Schalke, all four being core members of the Management Team at that time, drew up outlines of a Science and an Outreach Programme. In 2005, following the UN proclamation of 2008 as the United Nations International Year of Planet Earth, the Year grew into a triennium, 2007-2009.
