emaraviruses Using the case studies common oak *Quercus robur* L and common ash *Fraxinus excelsior* L epidemiological studies revealed a wide distribution of common oak ringspot associated virus CORaV and ash shoestring associated virus ASaV in forest and urban trees CORaV and ASaV can be differentiated from other pathogens based on specific leaf symptoms With the help of a newly developed diagnostic ELISA CORaV can be reliably detected serologically in diseased oak trees A new species of rust mite is likely to be the vector for virus transmission Based on the results considering the composition of emaraviral accessory proteins the taxonomic order of the genus Emaravirus can be revised In addition to ASaV cytorhabdoviruses were shown to frequently infect common ash in natural and managed forest sites Genetic characterization provided evidence for two distinct cytorhabdovirus species affecting not only *Fraxinus excelsior* but also manna ash *Fraxinus ornus* and red ash *Fraxinus pennsylvanica* Applying High throughput sequencing HTS analyses sequence information about novel viruses belonging to different families have been revealed The doctoral thesis provides new insights into the diverse virome of deciduous trees thereby highlighting the demand for further studies on this fascinating group of pathogens Their characterization and interaction with other abiotic and biotic stressors may serve as a basis for better disease management concepts of essential long living trees in the future Acid Rain, 1984 United States.
