Fundamentals of Global Air Transport Geography George Arbuckle, 2025-04-14 The commercial air transport industry can be broadly split into three component parts airlines airports and aircraft Each of these components is shaped by geography insofar as each is influenced by places landscapes environments people and their various interactions Conversely air transport plays a large role in shaping the various themes of geography and the position of our physical human and environmental world It connects people cultures and businesses across every continent and generates economic growth allows international trade to occur and develops tourism It can also be involved in creating negative outputs such as emissions noise and loss of biodiversity which can have a large impact on the planet and quality of life A lack of air transport links can also have a significantly negative impact on world regions in terms of economic and cultural development In short air transport and geography are inextricably

linked Fundamentals of Global Air Transport Geography details the geography of the global commercial air transport industry The book aims to provide an understanding of these key areas at an introductory level in order to be accessible to students and non technical airport airline management A key theme throughout the book will not only be how geographical issues have influenced air transport but also how air transport continues to influence geography Each chapter boasts a range of features aimed at enhancing the reader s understanding including learning objectives discussion questions and case studies and lecturers can find supporting resources including PowerPoint slides and teaching notes online [Antarctic Biology: Scale Matters](#) Peter Convey,Katrin Linse,Huw James Griffiths,Bruno Danis,Anton Pieter Van de Putte,Alison Elizabeth Murray,2020-06-04 [Plant Diversity Patterns and Drivers](#) Qing Zhang,Gang Feng ,Jinliang Liu,2024-09-20 Biodiversity can provide a series of important ecosystem functions and ecosystem services which meet the needs of human beings Plants are the biological group with the highest carbon content on earth their diversity has attracted increased attention The interpretation of plant diversity patterns and drivers is crucial for the conservation and utilization of plant resources and is also one of the hot topics in plant science and ecology There are already many studies on the patterns and drivers of plant diversity including different diversity dimensions e g taxonomic phylogenetic and functional diversity and spatial scales different plots sites watershed country continent and globe The mechanisms underlying plant diversity patterns are also quite complex For example many hypotheses are related to contemporary climate and soil conditions with temperature precipitation and soil nutrient being the most discussed drivers In addition paleoclimate and geological events may also have a strong legacy on current plant diversity patterns Except for these natural factors many anthropogenic activities including agriculture deforestation grazing urbanization and coal mining are also important drivers of plant diversity These anthropogenic activities can affect plant diversity patterns not only directly but also indirectly through their effects on habitat loss and habitat fragmentation Therefore the current plant diversity patterns are the result of many interacting factors and need to be interpreted from a more comprehensive perspective This Research Topic will therefore provide a platform for sufficient communication aiming to integrate the research from different fields and deepen the understanding of the patterns and drivers of plant diversity We encourage the submission of theoretical and experimental studies on different plant groups such as seed plants ferns mosses and algae Studies based on new methods and technology such as genomics and drones are also welcomed We welcome the following specific topics Effects of historical factors such as paleoclimate geological events on plant diversity Plant diversity that driven by contemporary climate and anthropogenic activities The effect of habitat loss and fragmentation on plant diversity New methods of research on the patterns and drivers of plant diversity **Mountains, Climate and Biodiversity** Carina Hoorn,Allison Perrigo,Alexandre Antonelli,2018-02-22 Mountains Climate and Biodiversity A comprehensive and up to date synthesis for students and researchers Mountains are topographically complex formations that play a fundamental role in regional and continental scale climates They are also

cradles to all major river systems and home to unique and often highly biodiverse and threatened ecosystems But how do all these processes tie together to form the patterns of diversity we see today Written by leading researchers in the fields of geology biology climate and geography this book explores the relationship between mountain building and climate change and how these processes shape biodiversity through time and space In the first two sections you will learn about the processes theory and methods connecting mountain building and biodiversity In the third section you will read compelling examples from around the world exploring the links between mountains climate and biodiversity Throughout the 31 peer reviewed chapters a non technical style and synthetic illustrations make this book accessible to a wide audience A comprehensive glossary summarises the main concepts and terminology Readership Mountains Climate and Biodiversity is intended for students and researchers in geosciences biology and geography It is specifically compiled for those who are interested in historical biogeography biodiversity and conservation
