

How Psychologists Study Social Behavior

Scientific research is a bit like detective work. A detective begins with a mystery and a set of procedures for solving that mystery: interview witnesses, look for a motive, try to rule out various suspects, examine the material evidence, and so on. There are pitfalls at every step: witnesses may lie or base their testimony on unfounded assumptions, some motives may be hidden, and the evidence may have been tampered with. Like other scientists, social psychologists begin with mysteries. We opened this chapter with several, including: What causes people to engage in unusual mob behavior, as in the swooning crowds of Sinatra fans? What causes some people to thirst for achievement, as in the case of mountain-climbing socialite Sandy Hill Pittman? Like detectives, social psychologists have a set of procedures for solving such mysteries and, like detectives, they must also be aware of certain potential pitfalls involved in using these procedures. The methods used by social psychologists can be roughly divided into two categories: descriptive and experimental. Descriptive methods involve attempts to measure or record behaviors, thoughts, or feelings in their natural state. When psychologists use descriptive methods, they hope to record behaviors without changing them in any way. Experimental methods, on the other hand, are attempts to manipulate social processes by varying some aspect of the situation. Experiments do not necessarily tell us the when and where of everyday social encounters outside the laboratory, but they help us understand and explain those encounters, answering the "why" question.

Descriptive Methods

How does one go about carefully describing social behavior? Social psychologists use five major types of descriptive methods: naturalistic observation, case studies, archives, surveys, and psychological tests.

Naturalistic Observation

Perhaps the most straightforward descriptive method is naturalistic observation. It involves, quite simply, observing behavior as it unfolds in its natural setting. As one example, Irenäus Eibl-Eibesfeldt (1975) visited numerous cultures around the world and used a hidden camera to observe women flirting with men. In another study of nonverbal communication between the sexes, psychologist Monica Moore (1985) went to a setting where she expected women to naturally show a lot of nonverbal flirtation behaviors—a singles' bar. There she found several patterns of behavior not likely to be seen in comparison settings such as a library or women's center meeting. For instance, a woman in the bar would frequently glance at a man for a few seconds, smile, flip her hair, and tilt her head at a 45-degree angle so her neck was exposed. Naturalistic observation has a number of advantages as a research method. Behavior in a natural setting is spontaneous, for example, rather than artificial and contrived. In contrast,

Scientific Study Of Social Behavior:

The Scientific Study of Social Behavior Michael Argyle, 1957 *The scientific study of social behaviour* Michael Argyle, 1959 The Scientific Study of Social Behaviour (Psychology Revivals) Michael Argyle, 2013-11-26 Originally published in 1957 this book presented an up to date account of psychological research into human social behaviour of the time There are chapters on interaction between pairs of people behaviour in small social groups and human relations in industry The author avoided the adoption of any particular theoretical position and concentrated on the established empirical findings of the time The results of several hundred investigations are summarised and compared so that the principal generalisations which emerge can be seen Stress is placed on rigorous methods of research and a critical account is given of current techniques of social research showing the importance of experimental and statistical methods Careful consideration is given to the danger of the investigator disturbing what is being investigated Use is made of recent ideas about theory and explanation and the different kinds of theory used in experimental psychology were considered for the first time as possible ways of accounting for group behaviour This book was intended not only for students of psychology and of the other social sciences but also for industrialists administrators and indeed all who were interested in the laws underlying social behaviour Today it can be read and enjoyed in its historical context

What Determines Social Behavior? Investigating the Role of Emotions, Self-Centered Motives, and Social Norms

Corrado Corradi-Dell'Acqua, Leonie Koban, Susanne Leiberg, Patrik Vuilleumier, Ernst Fehr, 2016-09-28 Human behavior and decision making is subject to social and motivational influences such as emotions norms and self other regarding preferences The identification of the neural and psychological mechanisms underlying these factors is a central issue in psychology behavioral economics and social neuroscience with important clinical social and even political implications However despite a continuously growing interest from the scientific community the processes underlying these factors as well as their ontogenetic and phylogenetic development have so far remained elusive In this Research Topic we collect articles that provide challenging insights and stimulate a fruitful controversy on the question of what determines social behavior Indeed over the last decades research has shown that introducing a social context to otherwise abstract tasks has diverse effects on social behavior On the one hand it may induce individuals to act irrationally for instance to refuse money but on the other hand it improves individuals reasoning in that formerly difficult abstract problems can be easily solved These lines of research led to distinct although not necessarily mutually exclusive models for socially driven behavioral changes For instance a popular theoretical framework interprets human behavior as a result of a conflict between cognition and emotion

with the cognitive system promoting self interested choices and the emotional system triggered by the social context operating against them Other theories favor social norms and deontic heuristics in biasing human reasoning and encouraging choices that are sometimes in conflict with one s interest Few studies attempted to disentangle between these as well as other models As a consequence although insightful results arise from specific domains tasks a comprehensive theoretical framework is still missing Furthermore studies employing neuroimaging techniques have begun to shed some light on the neural substrates involved in social behavior implicating consistently although not exclusively portions of the limbic system the insular and the prefrontal cortex In this context a challenge for present research lies not only in further mapping the brain structures implicated in social behavior or in describing in detail the functional interaction between these structures but in showing how the implicated networks relate to different theoretical models This is Research Topic hosted by members of the Swiss National Center of Competence in Research Affective Sciences Emotions in Individual Behaviour and Social Processes We collected contributions from the international community which extended the current knowledge about the psychological and neural structures underlying social behavior and decision making In particular we encouraged submissions from investigators arising from different domains psychology behavioral economics affective sciences etc implementing different techniques behavior electrophysiology neuroimaging brain stimulations on different populations neurotypical adults children brain damaged or psychiatric patients etc Animal studies are also included as the data reported are of high comparative value Finally we also welcomed submissions of meta analytical articles mini reviews and perspective papers which offer provocative and insightful interpretations of the recent literature in the field
