Stories Edward E. Leamer, 2008-11-21 The story of this book began with my difficult transition from teaching international economics and econometrics in Economics Ph D programs at Harvard and UCLA to teaching in the MBA programs at the Anderson School at UCLA On the basis of 20 years of apparent teaching success in Ph D education I arrived at the Anderson School in 1990 with a self image as a star teacher but I was greeted with highly disturbing mediocre teaching evaluations Faced with a data set that was inconsistent with my view of reality I did what analysts usually do I formulated a theory why the data were misleading Here is how I thought about it Two aspects of the course content and amusement drive numerical course evaluations If you rank courses by the average of the content score and the amusement score then the component that can be measured most accurately will determine the ranking Do you understand why It is what erasing does it eliminates the noise Suppose for example that a student cannot tell anything about the content and the content score is simply a random number varying from student to student Those random numbers will average out across students to about the same number for each course As the average course content score is about the same for every course it is the amusement score that will drive the rankings

Time Series Analysis and Adjustment Haim Y. Bleikh, Warren L. Young, 2016-02-24

In Time Series Analysis and Adjustment the authors explain how the last four decades have brought dramatic changes in the way researchers analyze economic and financial data on behalf of economic and financial institutions and provide statistics to whomsoever requires them. Such analysis has long involved what is known as econometrics but time series analysis is a different approach driven more by data than economic theory and focused on modelling. An understanding of time series and the application and understanding of related time series adjustment procedures is essential in areas such as risk management, business cycle analysis and forecasting. Dealing with economic data involves grappling with things like varying numbers of working and trading days in different months and movable national holidays. Special attention has to be given to such things. However, the main problem in time series analysis is randomness. In real life data patterns are usually unclear and the challenge is to uncover hidden patterns in the data and then to generate accurate forecasts. The case studies in this book demonstrate that time series adjustment methods can be efficaciously applied and utilized for both analysis and forecasting but they must be used in the context of reasoned statistical and economic judgment. The authors believe this is the first published study to really deal with this issue of context.
