

Physiological/Biological Psychology – BSP4223

Physiological Psychology

- is the study of the physiological basis of how we think, connecting the physical operation of the brain with what we actually say and do.
- It is thus concerned with brain cells, brain structures and components, brain chemistry, and how all this leads to speech and action.
- It is also, of course, important to understand how we take information from our five senses.
- It relates an activity to how the brain and other organ's function, even at the cellular and chemical levels.
- The body is a machine, and, like any other machine, it converts one kind of energy into another kind of energy. Among other things, the body converts chemical energy into various kinds of brain activity and into the movement of various parts of the body.

The Goals of Research

The goal of all scientists is to explain the phenomena they study. Scientific explanation takes two forms: generalization and reduction.

Generalization

- They explain particular instances of behavior as examples of general laws, which they deduce from their experiments.

Reduction

- They explain complex phenomena in terms of simpler ones.

The TASK of the Physiological Psychologist

- is to explain behavior in physiological terms. But physiological psychologists cannot simply be reductionists.
- We must understand "psychologically" why a particular behavior occurs before we can understand what physiological events made it occur.

Behavioral Example

- Mice will build nests under two conditions: when the air temperature is low and when the animal is pregnant.
- Nest building can be studied as behavior related to the process of temperature regulation, or it can be studied in the context of parental behavior.

Physiological mechanisms can tell us something about psychological processes.

- Damage to a specific part of the brain can cause very specific impairments in a person's language abilities.
- Damage to another region of the brain can produce extreme difficulty in reading unfamiliar words by sounding them out, but it does not impair the person's ability to read words with which he or she is already familiar.

Biological Roots of Physiological Psychology

Rene Descartes

- His speculations about the roles of the mind and brain in the control of behavior provide a good starting point in the history of physiological psychology.
- To Descartes, animals were mechanical devices; their behavior was controlled by environmental stimuli.
- His view of the human body was much the same: it was a machine. Reactions like this did not require participation of the mind; they occurred automatically. He called them reflexes.

DUELIST

Descartes believed that each person possesses a mind - a unique human attribute that is not subject to the laws of the universe. He was the first to suggest that a link exists between the human mind and its purely physical housing, the brain.
