World (1758-1998) Victor Fet, Norman I. Platnick, W. David Sissom, 1997 This unique and timely publication is the first such Catalog to be produced in over 100 years The last full survey of the taxonomy of the world fauna of the Order Scorpiones was by Karl Kraepelin in 1899 *Scorpiones und Pedipalpi Das Tierreich Herausgegeben von der Deutschen Zoologischen Gesellschaft Berlin* Since then the sheer number of known species and subspecies has increased more than fourfold and the classification of scorpions has been greatly transformed at both the generic and familial levels This new Catalog brings together under one cover an enormous amount of difficult to locate information on scorpion nomenclature biogeography distribution and phylogeny published before and after Kraepelin's time It is of special interest because of the unique status that scorpions currently enjoy as models for the study of evolutionary biology ecology toxicology and physiology The Catalog is much more than a checklist it is an annotated organized compendium of the status of the entire field of Scorpion Taxonomy at the beginning of the New Millennium by authoritative and critical researchers working in the field The authors have coordinated and collaborated extensively to make this a fully integrated work The utility of the Catalog is enormously enhanced by the inclusion of much greater detail than other animal catalogs including type data tracing of full synonymies of all names clarification or critical discussion of known nomenclatural problems comprehensive cross index and notes on biogeography and phylogeny

Medical Insects and Arachnids R.P. Lane, R.W. Crosskey, 2012-12-06 Surprising though it seems the world faces almost as great a threat today from arthropod borne diseases as it did in the heady days of the 1950s when global eradication of such diseases by eliminating their vectors with synthetic insecticides particularly DDT seemed a real possibility Malaria for example still causes tremendous morbidity and mortality throughout the world especially in Africa Knowledge of the biology of insect and arachnid disease vectors is arguably more important now than it has ever been Biological research directed at the development of better methods of control becomes even more important in the light of the partial failure of many control schemes that are based on insecticide although not all is gloom since basic biological studies have contributed enormously to the outstanding success of international control programmes such as the vast Onchocerciasis Control Programme in West Africa It is a sine qua non for proper understanding of the epidemiology and successful vector control of any human disease transmitted by an arthropod that all concerned with the problem medical entomologist parasitologist field technician have a good basic understanding of the arthropod's biology Knowledge will be needed not only of its direct relationship to any parasite or pathogen that it transmits but also of its structure its life history and its behaviour in short its natural history Above all it will be necessary to be sure that it is correctly identified

Neurochemical Techniques in Insect Research H. Breer, T.A. Miller, 2012-12-06 Neurochemical Techniques in Insect Research properly emphasizes the insect It only scratches the surface of the exploding repertoire of general neuro chemical techniques that can be applied to insect research in 1985 But it also presents the advantages of using insects for studying certain biological questions that are approachable by

neurochemical techniques Even more so it summarizes the long list of unique problems encountered in attempting to study insects by neurochemical techniques As in other volumes of this series the contributors to this volume are the authorities in the field They themselves have developed much of the material presented Thus the sum effort provides a true description of the state of the art and pleasantly it does so in a very complete and clear manner Readers of this series will not need to be reminded that despite the fact that vertebrates make up only about 3% of all animal species research in in vertebrates such as insects has lagged behind that on vertebrates at least in the neurochemistry area the relative simplicity and large cell size of the in sect nervous system has always provided incentive for work in neurophysiol ogy and neuroanatomy Toxicology interests will always stimulate a certain amount of work on insect neuropharmacology and insects are extremely suitable for several areas of toxin research Last but not least the insects are beautiful organisms for which the applications of genetics can be made to the study of nervous system function
