**Constraint Solving and Language Processing** Henning Christiansen, Peter Rossen Skadhauge, Jørgen Villadsen, 2005-05-30 This volume contains selected and thoroughly revised papers plus contributions from invited speakers presented at the First International Workshop on Constraint Solving and Language Processing held in Roskilde, Denmark, September 1-3, 2004. Constraint Programming and Constraint Solving in particular, Constraint Logic Programming, appear to be a very promising platform, perhaps the most promising present platform for bringing forward the state of the art in natural language processing. This is due to the naturalness in specification and the direct relation to efficient implementation. Language in the present context may refer to written and spoken language, formal and semiformal language, and even general input data to multimodal and pervasive systems which can be handled in very much the same ways using constraint programming. The notion of constraints, with slightly differing meanings, apply in the characterization of linguistic and cognitive phenomena in formalized linguistic models as well as in implementation-oriented frameworks. Programming techniques for constraint solving have been, and still are, in a period with rapid development of new efficient methods and paradigms from which language processing can profit. A common metaphor for human language processing is one big constraint-solving process in which the different specified linguistic and cognitive phases take place in parallel and with mutual cooperation, which fits quite well with current constraint programming paradigms.

**Dissemination of Information in Optical Networks:** Subir Bandyopadhyay, 2007-10-24 Optical networks and the related technologies, network management software, and services have undergone remarkable developments, and such networks are now the ultra-high-speed backbone networks for communication. Wavelength Division Multiplexing (WDM), the ability to support multiple communication pathways over the same fiber, enables efficient use of the enormous capability for data communication of optical networks. This book gives a broad overview of techniques used in the design of WDM networks for efficient dissemination of information in computer networks. It starts with an overview of the hardware components, then provides a thorough review of WDM wavelength-routed networks, algorithms for route and wavelength assignment, design of broadcast

and select networks logical topology design and techniques to handle faults and algorithms for efficient use of optical networks Each topic has been covered rigorously with emphasis on detailed explanations of the approaches used starting from the fundamentals up to the state of the art The optimization techniques covered in the book include graph theoretic algorithms mixed integer linear programming and heuristics The book is intended for beginners as well as for specialists and the reader should be able to design WDM networks and follow developments in the field Each chapter contains a detailed annotated bibliography There are numerous exercises for the reader to test understanding of the subject while readers unfamiliar with mathematical programming techniques and network flow optimization are offered short easy to understand appendices at the end of the book
