Flight mechanics and flight control for a multibody aircraft Köthe, Alexander, 2019-06-26 Aircraft operating as so called High Altitude Platform Systems HAPS have been considered as a complementary technology to satellites since several years These aircraft can be used for similar communication and monitoring tasks while operating at a fraction of the cost Such concepts have been successfully tested Those include the AeroVironment Helios and the Airbus Zephyr with an endurance of nearly 624 hours 26 days All these HAPS aircraft have a high aspect ratio wing using lightweight construction In gusty atmosphere this results in high bending moments and high structural loads which can lead to overloads Aircraft crashes for example from Google's Solara 50 or Facebook's Aquila give proof of that fact Especially in the troposphere where the active weather takes place gust loads occur which can lead to the destruction of the structure The Airbus Zephyr the only HAPS aircraft without flight accidents provides only a very small payload Thus it does not fully comply with the requirements for future HAPS aircraft To overcome the shortcomings of such single wing aircraft so called multibody aircraft are considered to be an alternative The concept assumes multiple aircraft connected to each other at their wingtips It goes back to the German engineer Dr Vogt In the United States shortly after the end of World War II he experimented with the coupling of manned aircraft This resulted in a high aspect ratio wing for the aircraft formation The range of the formation could be increased correspondingly The engineer Geoffrey S Sommer took up Vogt's idea and patented an aircraft configuration consisting of several unmanned aerial vehicles coupled at their wingtips However the patent does not provide any insight into the flight performance the flight mechanical modeling or the control of such an aircraft Single publications exist that deal with the performance of coupled aircraft A profound complete analysis however is missing so far This is where the present work starts For the first time a flying vehicle based on the concept of the multibody aircraft will be analyzed in terms of flight mechanics and flight control In a performance analysis the aircraft concept is analyzed in detail and the benefits in terms of bending moments and flight performance are clearly highlighted Limits for operation in flight are shown considering aerodynamic optimal points The joints at the wingtips allow a roll and pitch motion of the individual aircraft This results in additional degrees of freedom for the design through the implementation of different relative pitch and bank angles For example using individual pitch angles for individual aircraft further decreases the induced drag and increases flight performance Because the lift is distributed symmetrically but not

homogenously along the wingspan a lateral trim of the individual aircraft in formation flight becomes necessary. The thesis presents a new method to implement this trim by moving the battery mass along half the wingspan which avoids additional parasite drag. Further a complete flight dynamics model is provided and analyzed for aircraft that are mechanically connected at their wingtips. To study this model in detail a hypothetical torsional and bending spring between the aircraft is introduced. If the spring constants are very high the flight dynamics model has properties similar to those of an elastic aircraft. Rigid body and formation eigenmotions can be clearly distinguished. If the spring constants are reduced towards zero which represents the case of the multibody aircraft classical flight mechanics eigenmotions and modes resulting from the additional degrees of freedom are coupled. This affects the eigenstructure of the aircraft. Hence normal motions with respect to the inertial space as known from a rigid aircraft cannot be observed anymore. The plant also reveals unstable behavior. Using the non linear flight dynamics model flight controllers are designed to stabilize the plant and provide the aircraft with an eigenstructure similar to conventional aircraft. Different controller design methods are used. The flight controller shall further maintain a determined shape of the flight formation it shall control flight bank and pitch angles and it shall suppress disturbances. Flight control theories in the time domain Eigenstructure assignment and in the frequency domain H_∞ loop shaping are considered. The resulting inner control loops yield a multibody aircraft behavior that is similar to the one of a rigid aircraft. For the outer control loops classical autopilot concepts are applied. Overall the flight trajectory of the multibody aircraft above ground is controlled and thus an actual operation as HAPS is possible. In the last step the flight controller is successfully validated in non linear simulations with complete flight dynamics.

Flugzeuge in der Form von sogenannten High Altitude Plattformen (HAPS) werden seit einigen Jahren als kostengünstige Ergänzung zu teuren Satelliten betrachtet. Diese Flugzeuge können für ähnliche Kommunikations- und Überwachungsaufgaben eingesetzt werden. Zu den gegenwärtigen Konzepten solcher Fluggeräte, die bereits erfolgreich im Flugversuch eingesetzt wurden, zählen der Helios von AeroVironment und der Airbus Zephyr, der eine Flugdauer von fast 624 Stunden (26 Tagen) erreicht hat. Alle diese HAPS-Flugzeuge besitzen einen flügel langen Streckung, der in Leichtbauweise konstruiert ist. Hieraus resultieren in großer Atmosphäre hohe Biegemomente und starke strukturelle Belastungen, die zu Überbelastungen führen können. Flugunfälle beispielsweise von Googles Solara 50 oder Facebooks Aquila belegen dies. Insbesondere in der Troposphäre, in der das aktive Wetter stattfindet, treten Belastungen auf, die die Struktur zerstören können. Der Airbus Zephyr, der bisher als einziges HAPS-Flugzeug frei von Flugunfällen ist, besitzt nur eine sehr geringe Nutzlast. Daher kann er die Anforderungen an zukünftige HAPS-Flugzeuge nicht vollständig erfüllen. Um die Schwachstellen solcher flügel Konzepte zu überwinden, wird in dieser Arbeit ein alternatives Flugzeugkonzept betrachtet, das als Mehrkörperflugzeug bezeichnet wird. Das Konzept geht von mehreren an den flügelspitzen miteinander verbundenen Flugzeugen aus und beruht auf Ideen des deutschen Ingenieurs Dr. Vogt. Dieser hatte in den USA kurz nach Ende des Zweiten Weltkrieges bemannte Flugzeuge aneinanderkoppeln lassen.

Hierdurch ergab sich ein Flugzeugverbund mit einem Fl gel langer Streckung Damit konnte die Reichweite des Verbundes gesteigert werden Geoffrey S Sommer griff die Idee von Vogt auf und lies sich eine Flugzeugkonfiguration patentieren die aus mehreren unbemannten Flugzeugen besteht die an den Enden der Tragfl chen miteinander gekoppelt sind Die Patentschrift gibt jedoch keinen Einblick in die Flugleistungen die flugmechanische Modellierung oder die Regelung eines solchen Flugger tes Vereinzelt existieren Ver fentlichungen die sich mit den Flugleistungen von gekoppelten Luftfahrzeugen besch ftigen Eine tiefgreifende vollst ndige flugmechanische Analyse fehlt jedoch bisher Hier setzt die vorliegende Arbeit an Ein Flugger t basierend auf dem Konzept des Mehrk rperflug zeugs wird erstmalig hinsichtlich der Flugmechanik und Flugregelung untersucht In einer Flugleistungsbetrachtung wird das Flugzeugkonzept genau analysiert und die Vorteile hinsichtlich der Biegemomente und der Flugleistungen klar herausgestellt Die Grenzen des Einsatzes im Flugbetrieb werden mithilfe aerodynamischer Optimalpunkte aufgezeigt ber die Lager an den Fl gelspitzen die eine relative Roll und Nickbewegung der Flugzeuge untereinander erm glichen ergeben sich durch die Einstellung unterschiedlicher L ngslage und H ngewinkel zus tzliche Freiheitsgrade im Entwurf Die Verwendung unterschiedlicher Nicklagewinkel der einzelnen Flugzeuge reduziert beispielsweise den induzierten Widerstand weiter und steigert die Flugleistung Durch die symmetrische entlang der Spannweite jedoch nicht homogene Auftriebsverteilung ist auch eine laterale Trimmung der einzelnen Flugzeuge in der Formation notwendig Hier stellt die Arbeit eine neuartige M glichkeit vor um diese Trimmung ohne zus tzlichen parasit ren Widerstand mittels Verschiebung der Batteriemasse entlang der Halbspannweite umzusetzen Weiterhin wird ein vollst ndiges flugdynamisches Modell f r ber mechanische Lager verbundene Luftfahrzeuge aufgestellt und analysiert F r diese Analyse wird eine hypothetische Torsions und Biegefeder zwischen den Flugzeugen modelliert Sind die Federsteifigkeiten hinreichend hoch besitzt das flugdynamische Modell Eigenschaften die einem elastischen Flugzeug entsprechen Starrk rper und elastische Eigenbewegungsformen sind in diesem Fall klar separiert Bei immer weiterer Reduzierung bis auf eine Federsteifigkeit von Null kommt es zu Kopplungen zwischen den klassischen flugmechanischen Eigenbewegungsformen und den Moden aus den zus tzlichen Freiheitsgraden Dies stellt den Auslegungsfall f r das Mehrk rperflugzeug dar Hierbei ver ndert sich die Eigenstruktur engl eigenstructure des Flugzeugs und normale bei einem starren Flugzeug beobachtbare Bewegungen gegen ber dem inertialen Raum sind nicht mehr erkennbar Zus tzlich zeigt die Strecke instabiles Verhalten Basierend auf dem nichtlinearen flugdynamischen Modell werden mit verschiedenen Methoden Regler entworfen die die Regelstrecke stabilisieren und dem Flugzeug eine Streckenstruktur zuweisen die derjenigen klassischer Flugzeuge hnelt Zudem soll durch die Regler eine vorgegebene Form des Flugzeugverbundes beibehalten werden die Fahrt der L ngs und Rolllagewinkel sollen geregelt und St rungen unterdr ckt werden Als Auslegungsverfahren werden Theorien der Zustandsregelungen im Zeitbereich Eigenstrukturvorgabe und Frequenzbereich H infinity loop shaping verwendet Hierdurch wird durch die inneren Regelschleifen ein Verhalten des Mehrk rperflugzeugs erzielt das dem eines starren

Flugzeugs entspricht für die üblichen Regelschleifen werden anschließend klassische Konzepte von Autopiloten verwendet. Im Ergebnis ist eine Regelung des Flugweges über Grund des Mehrkörperfugzeugs und somit ein tatsächlicher Betrieb als HAPSMöglich. Die Funktionalität des Reglers wird abschließend in nichtlinearen Simulationen mit vollständiger Flugdynamik verifiziert. *Introduction to Aircraft Flight Mechanics*, 2003 **Mechanics of Flight** R. Mechanics of Flight Alfred Cotterill Kermode, 2012 *Mechanics of Flight* is an ideal introduction to the basic principles of flight for students embarking on courses in aerospace engineering student pilots apprentices in the industry and anyone who is simply interested in aircraft and space flight. Written in a straightforward and jargon-free style, this popular classic text makes the fascinating topic of aircraft flight engaging and easy to understand. Starting with an overview of the relevant aspects of mechanics, the book goes on to cover topics such as air and airflow, aerofoils, thrust, level flight, gliding, landing, performance, manoeuvre. Aerodynamics Aeronautics and Flight Mechanics Cezar Dalca, 2015-08 Aeronautics is defined as the science that treats of the operation of aircraft, also the art or science of operating aircraft. Basically, with aeronautics, one is concerned with predicting and controlling the forces and moments on an aircraft that is traveling through the atmosphere. A single comprehensive in-depth treatment of both basic and applied modern aerodynamics. The fluid mechanics and aerodynamics of incompressible and compressible flows with particular attention to the prediction of lift and drag characteristics of airfoils and wings and complete airplane configurations. Designed for courses in aerodynamics, aeronautics and flight mechanics, this text examines the aerodynamics, propulsion, performance, stability and control of an aircraft. This book captures some of the new technologies and methods that are currently being developed to enable sustainable air transport and space flight. It clearly illustrates the multi-disciplinary character of aerospace engineering and the fact that the challenges of air transportation and space missions continue to call for the most innovative solutions and daring concepts.

Flight Dynamics Principles Michael V. Cook, 2012-10-03 The study of flight dynamics requires a thorough understanding of the theory of the stability and control of aircraft, an appreciation of flight control systems and a grounding in the theory of automatic control. *Flight Dynamics Principles* is a student-focused text and provides easy access to all three topics in an integrated modern systems context. Written for those coming to the subject for the first time, the book provides a secure foundation from which to move on to more advanced topics such as non-linear flight dynamics, flight simulation, handling qualities and advanced flight control. Additional examples illustrate the application of computational procedures using tools such as MATLAB, MathCad and Program CC. Improved compatibility with and more expansive coverage of the North American notational style. Expanded coverage of lateral-directional static stability, manoeuvrability, command augmentation and flight in turbulence. An additional coursework study on flight control design for an unmanned air vehicle (UAV).

Flight Dynamics Robert F. Stengel, 2004-10-17 Flight Dynamics takes a new approach to the science and mathematics of aircraft flight unifying principles of aeronautics with contemporary systems analysis While presenting traditional material that is critical to understanding aircraft motions it does so in the context of modern computational tools and multivariable methods Robert Stengel devotes particular attention to models and techniques that are appropriate for analysis simulation evaluation of flying qualities and control system design He establishes bridges to classical analysis and results and explores new territory that was treated only inferentially in earlier books This book combines a highly accessible style of presentation with contents that will appeal to graduate students and to professionals already familiar with basic flight dynamics Dynamic analysis has changed dramatically in recent decades with the introduction of powerful personal computers and scientific programming languages Analysis programs have become so pervasive that it can be assumed that all students and practicing engineers working on aircraft flight dynamics have access to them Therefore this book presents the principles derivations and equations of flight dynamics with frequent reference to MATLAB functions and examples By using common notation and not assuming a strong background in aeronautics Flight Dynamics will engage a wide variety of
