Parabolic Boundary Value Problems Operator Theory Advances Applications S:

Free Boundary Problems in Fluid Flow with Applications J M Chadam, Helen Rasmussen, 1993-02-22 This is the third of three volumes containing the proceedings of the International Colloquium Free Boundary problems Theory and Applications held in Montreal from June 13 to June 22 1990 The main part of this volume studies the flow of fluids an area which has led to many of the classical free boundary problems The first two sections contain the papers on various problems in fluid mechanics The types of problems vary from the collision of two jets to the growth of a sand wave In the next two sections porous flow is considered This has important practical applications in fields such as petroleum engineering and groundwater pollution Some new and interesting free boundary problems in geology and engineering are treated in the final section

Parabolic Boundary Value Problems Samuil D. Eidelman, Nicolae V. Zhitarsky, 1999-12-01 The present monograph is devoted to the theory of general parabolic boundary value problems The vastness of this theory forced us to take difficult decisions in selecting the results to be presented and in determining the degree of detail needed to describe their proofs In the first chapter we define the basic notions at the origin of the theory of parabolic boundary value problems and give various examples of illustrative and descriptive character The main part of the monograph Chapters II to V is devoted to a detailed and systematic exposition of the L theory of parabolic 2 boundary value problems with smooth coefficients in Hilbert spaces of smooth functions and distributions of arbitrary finite order and with some natural applications of the theory Wishing to make the monograph more informative we included in Chapter VI a survey of results in the theory of the Cauchy problem and boundary value problems in the traditional spaces of smooth functions We give no proofs rather we attempt to compare different results and techniques Special attention is paid to a detailed analysis of examples illustrating and complementing the results for mulated The chapter is written in such a way that the reader interested only in the results of the classical theory of the Cauchy problem and boundary value problems may concentrate on it alone skipping the previous chapters

Elliptic Boundary Value Problems with Indefinite Weights, Variational Formulations of the Principal Eigenvalue, and Applications Fethi Belgacem, 1997-05-05 Elliptic Boundary Value Problems With Indefinite Weights presents a unified approach to the methodologies dealing with eigenvalue problems involving indefinite weights The principal eigenvalue for such problems is characterized for various boundary conditions Such characterizations are used in particular to formulate criteria for the persistence and extinctions of populations and applications of the formulations obtained can be quite extensive

Parabolicity, Volterra Calculus, and Conical Singularities Sergio Albeverio, Michael Demuth, Elmar Schrohe, Bert-Wolfgang Schulze, 2012-12-06 Partial differential equations constitute an integral part of mathematics They lie at the interface of areas as diverse as differential geometry functional analysis or the theory of Lie groups and have numerous applications in the applied sciences A wealth of methods has been devised for their analysis Over the past decades operator algebras in connection with ideas and structures from geometry topology and theoretical physics have contributed a

large variety of particularly useful tools One typical example is the analysis on singular configurations where elliptic equations have been studied successfully within the framework of operator algebras with symbolic structures adapted to the geometry of the underlying space More recently these techniques have proven to be useful also for studying parabolic and hyperbolic equations Moreover it turned out that many seemingly smooth noncompact situations can be handled with the ideas from singular analysis The three papers at the beginning of this volume highlight this aspect They deal with parabolic equations a topic relevant for many applications The first article prepares the ground by presenting a calculus for pseudo differential operators with an anisotropic analytic parameter In the subsequent paper an algebra of Mellin operators on the infinite space time cylinder is constructed It is shown how timelike infinity can be treated as a conical singularity

Abstract Spaces Robert Dragoni, Paolo Nistri, Pietro Zecca, Jack W Macki, 1996-04-03 This book presents results on the geometric topological structure of the solution set S of an initial value problem $x'(t) = f(t, x(t), x(0))$ when f is a continuous function with values in an infinite dimensional space A comprehensive survey of existence results and the properties of S is given when S is a connected set a retract an acyclic set is presented The authors also survey results on the properties of S for initial value problems involving differential inclusions and for boundary value problems This book will be of particular interest to researchers in ordinary and partial differential equations and some workers in control theory **Rings and Radicals** R.
