*Proc Eighth Asian Regional Conference on Soil Mechanics and Foundation Engineering, Kyoto, 20-24 July 1987 V1, P499-502. Publ Japan: Japanese Society for Soil Mechanics and Foundation Engineering, 1987*

Model tests were carried out on embankments of sand, reinforced with horizontal nonwoven geotextiles at different spacings, and loaded vertically. Settlements of up to 40% of embankment height were obtained. Deformations observed were in good agreement with forecasts of a simplified stability analysis assuming a circular slip surface. Maximum tensile strain was in an almost horizontal direction, indicating the importance of horizontal reinforcement.

Loed, E.R.F.; Isaac, B.A.A.  
*Can Geotech J V26, N1, Feb 1989, P122-133*

A field pilot study was conducted to assess the potential for constructing a stable overburden waste dump using hydraulic techniques. The overburden consists of Pleistocene clays and tills overlying Cretaceous clay shales. Laboratory disintegration-dispersion tests were carried out using slake durability, shaking table and pore fluid analysis. Geotechnical properties of the dredged materials were determined, including undrained shear strength, moisture content, effective stress, density, lump size distribution, settlement, and pore pressure. Also, responses to rapid drawdown, hydraulic lift construction and dry lift construction were considered.

Pitilakis, K.; Moutsaklis, A.  
*Soils Found V29, N1, March 1989, P1-17*

During an earthquake, the Kalamata quay wall, founded on sands and gravels overlying marls, moved 15cm horizontally and rotated slightly. The wall's behaviour was studied using 2-D finite element analysis and 2 conventional methods, limited strength analysis and limited displacement analysis. Results are compared with measured values.

*Proc Conference on Hydraulic Fill Structures, Fort Collins, 13-18 April 1988 P32-51. Publ New York: ASCE, 1988 (Geotechnical Special Publication No 21)*

Data have been collected about large sand dams constructed in estuaries by hydraulic fill methods. Construction procedures and phenomena observed are briefly described. Field and laboratory tests were carried out to study sand-water mixture flow above the water level. A theoretical formula for the equilibrium slope is presented and shows agreement with the empirical equilibrium slope. Field and laboratory tests and theoretical studies of sand-water mixture flow below the water level, leading to formation of the underwater slope, are described. Measurements of density of the sand body are essential to dam stability and experiments show sand characteristics influence the density.

*Proc Conference on Hydraulic Fill Structures, Fort Collins, 13-18 April 1988 P103-129. Publ New York: ASCE, 1988 (Geotechnical Special Publication No 21)*

Dredged sand used for underwater earthfills is of variable density, produces small slope angles in mounds and is easily eroded by currents or wave action. A method to improve the engineering characteristics by pumping water out of the submerged sandfill during placement is tested on a small and larger scale. Laboratory tests in a glass tank with a drainage element at the base support the basic concept that slope steepness can be modified during fill placement by using seepage forces on the growing mound. Density tests in a glass cylinder show no correlation between seepage gradient and density. Large scale model tests studied sand fill islands with seepage via a circular header and vertical wells. Slope angle of 29 deg was achieved. Packing density was tested by miniature cone penetration tests, showing a strong correlation with slope angle, and density tests confirmed laboratory results. Waveflume experiments studied the influence of seepage on resistance to liquefaction and erosion.

Cooper, D.

*Proc Conference on Hydraulic Fill Structures, Fort Collins, 13-18 April 1988 P130-141. Publ New York: ASCE, 1988 (Geotechnical Special Publication No 21)*

Tailings storages in Australia are usually raised with embankments on all sides due to the arid climate. Early storage used the single point discharge beaching system, with a ring main introduced to distribute slurry around the full perimeter when grain size decreased with improved grading. Current management retains the spigot technique, although machine excavation is now used. Tailings operation is constrained by limited area available and the need to maximise water return. Correct management of large tailings storage requires knowledge of geotechnical parameters, bearing capacity, moisture content, permeability, shrinkage, consolidation and rate of moisture loss. Increasing environmental constraints make it necessary to consider long term consolidation, strength and chemical composition of tailings.

Alici, T.A.  
*Proc 6th International Conference on Expansive Soils, New Delhi, 1-4 December 1987 P359-366. Publ Rotterdam: A A Balkema, 1988*

The application of probabilistic methods to the design of hydraulic structure foundations or canal beds is illustrated. Criteria to be met may be strength, structural deformability or resistance to scouring or silting. The problems of accurate evaluation of displacements using deterministic formulae are addressed. Predictive equations for channel scouring are developed.
