Quasars And Gravitational Lenses:

Gravitational Lensing of Quasars Alexander Eigenbrod, 2011-12-14 The universe in all its richness diversity and complexity is populated by a myriad of intriguing celestial objects Among the most exotic of them are gravitationally lensed quasars A quasar is an extremely bright nucleus of a galaxy and when such an object is gravitationally lensed multiple images of the quasar are produced this phenomenon of cosmic mirage can provide invaluable insights on burning questions such as the nature of dark matter and dark energy After presenting the basics of modern cosmology Gravitational Lensing of Quasars describes active galactic nuclei the theory of gravitational lensing and presents a particular numerical technique to improve the resolution of astronomical data The book then enters the heart of the subject with the description of important applications of gravitational lensing of quasars such as the measurement of the famous Hubble constant the determination of the dark matter distribution in galaxies and the observation of the mysterious inner parts of quasars with much higher resolutions than those accessible with the largest telescopes This book gives an overview of the current status of research in the field of gravitationally lensed quasars It also gives some insights about the way this research is conducted in practice and presents real data and results obtained with several high technology instruments of the Very Large Telescope of the European Southern Observatory

Université de Liège. Institut d'astrophysique, 1983 Gravitational Lensing Yannick Mellier, Bernard Fort, Geneviève Soucail, 1990 This is an exhaustive review of our theoretical and observational knowledge of gravitational lensing 10 years after the discovery of the first lensed quasar Q0957 561 Gravitational optics optical infrared and radio observations of quasar lens candidates microlensing arcs in clusters of galaxies and radio rings are presented In particular the continuing survey of quasar lens candidates the new measurement of the time delay in 0957 561 the suspended microlensing effect through the galaxy 2237 030 as well as the discovery of new arcs and the measurement of new redshifts for two of them are presented Numerous papers on the modelling of arcs and rings show how it should be possible to probe dark matter with these unexpected gravitational telescopes Finally tables summarize all the lens candidates we know today

P. Schneider, J. Ehlers, E.E. Falco, 2013-06-29 Light observed from distant objects is found to be deflected by the gravitational field of massive objects near the line of sight an effect predicted by Einstein in his first paper setting forth the general theory of relativity and confirmed by Eddington soon afterwards If the source of the light is sufficiently distant and bright and if the intervening object is massive enough and near enough to the line of sight the gravitational field acts like a lens focusing the light and producing one or more bright images of the source This book by renowned researchers in the field begins by discussing the basic physics behind gravitational lenses the optics of curved space time It then derives the appropriate equations for predicting the properties of these lenses In addition it presents up to date observational evidence for gravitational lenses and describes the particular properties of the observed cases The authors also discuss applications of the
