Quasilinearization, Invariant Imbedding, and the Calculation of Eigenvalues

Richard Bellman,Harriet H. Natsuyama,Robert E. Kalaba,1965 Several eigenvalue problems for systems of ordinary differential equations are considered They are resolved computationally using the quasilinearization technique a quadratically convergent successive approximation scheme The essential idea presented is to consider an eigenvalue problem to be a system identification problem Also shown is the use of invariant imbedding techniques to obtain good initial estimates for eigenvalues in some neutron multiplication processes Author

Handbook of Differential Equations Daniel Zwillinger,2014-05-12 Handbook of Differential Equations is a handy reference to many popular techniques for solving and approximating differential equations including exact analytical methods approximate analytical methods and numerical methods Topics covered range from transformations and constant coefficient linear equations to finite and infinite intervals along with conformal mappings and the perturbation method Comprised of 180 chapters this book begins with an introduction to transformations as well as general ideas about differential equations and how they are solved together with the techniques needed to determine if a partial differential equation is well posed or what the natural boundary conditions are Subsequent sections focus on exact and approximate analytical solution techniques for differential equations along with numerical methods for ordinary and partial differential equations This monograph is intended for students taking courses in differential equations at either the undergraduate or graduate level and should also be useful for practicing engineers or scientists who solve differential equations on an occasional basis

Computing Methods in Optimization Problems A. V. Balakrishnan,Lucien W. Neustadt,2014-05-12 Computing Methods in Optimization Problems deals with hybrid computing methods and optimization techniques using computers One paper discusses different numerical approaches to optimizing trajectories including the gradient method the second variation method and a generalized Newton Raphson method The paper cites the advantages and disadvantages of each method and compares the second variation method a direct method with the generalized Newton Raphson method an indirect method An example problem illustrates the application of the three methods in minimizing the transfer time of a low thrust ion rocket between the orbits of Earth and Mars Another paper discusses an iterative process for steepest ascent optimization of orbit transfer trajectories to minimize storage requirements such as in reduced memory space utilized in guidance computers By eliminating state variable storage and control schedule storage the investigator can achieve reduced memory requirements Other papers discuss dynamic programming invariant imbedding quasilinearization Hilbert space and the computational aspects of a time optimal control problem The collection is
