## Internet

- Internet is a world-wide global system of interconnected computer networks.
- Internet uses the standard Internet Protocol *TCP/IP*.
- Every computer in internet is identified by a unique IP address.
- IP Address is a unique set of numbers such as 10.22.33.114 which identifies a computer location.
- A special computer DNS *DomainNameServer* is used to give name to the IP Address so that user can locate a computer by a name.
- For example, a DNS server will resolve a name **<http://www.tutorialspoint.com>** to a particular IP address to uniquely identify the computer on which this website is hosted.
- Internet is accessible to every user all over the world.

## Internet Evolution

The concept of Internet was originated in 1969 and has undergone several technological & infrastructural changes as discussed below:

- The origin of Internet devised from the concept of **Advanced Research Project Agency Network ARPANET**.
- **ARPANET** was developed by United States Department of Defense.
- Basic purpose of ARPANET was to provide communication among the various bodies of government.
- Initially, there were only four nodes, formally called **Hosts**.
- In 1972, the **ARPANET** spread over the globe with 23 nodes located at different countries and thus became known as **Internet**.
