differential geometric structures and also in physical applications of quaternionic geometry Some generalizations of classical quaternion like structures like HKT structures and hyper Kähler manifolds with singularities appeared naturally and were studied Some of those results are published in this book

Essays in Mathematics and its Applications Themistocles M. Rassias, Panos M. Pardalos, 2016-06-14 This volume dedicated to the eminent mathematician Vladimir Arnold presents a collection of research and survey papers written on a large spectrum of theories and problems that have been studied or introduced by Arnold himself Emphasis is given to topics relating to dynamical systems stability of integrable systems algebraic and differential topology global analysis singularity theory and classical mechanics A number of applications of Arnold's groundbreaking work are presented This publication will assist graduate students and research mathematicians in acquiring an in depth understanding and insight into a wide domain of research of an interdisciplinary nature

Riemannian Submersions and Related Topics Maria Falcitelli, Anna Maria Pastore, Stere Ianuş, 2004 This book provides the first ever systematic introduction to the theory of Riemannian submersions which was initiated by Barrett O'Neill and Alfred Gray less than four decades ago The authors focus their attention on classification theorems when the total space and the fibres have nice geometric properties

Geometry of Principal Sheaves Efstathios Vassiliou, 2006-03-30 The book provides a detailed introduction to the theory of connections on principal sheaves in the framework of Abstract Differential Geometry ADG This is a new approach to differential geometry based on sheaf theoretic methods without use of ordinary calculus This point of view complies with the demand of contemporary physics to cope with non smooth models of physical phenomena and spaces with singularities Starting with a brief survey of the required sheaf theory and cohomology the exposition then moves on to differential triads the abstraction of smooth manifolds and Lie sheaves of groups the abstraction of Lie groups Having laid the groundwork the main part of the book is devoted to the theory of connections on principal sheaves incorporating connections on vector and associated sheaves Topics such as the moduli sheaf of connections classification of principal sheaves curvature flat connections and flat sheaves Chern Weil theory are also treated The study brings to light fundamental notions and tools of the standard differential geometry which are susceptible of the present abstraction and whose role remains unexploited in the classical context because of the abundance of means therein However most of the latter are nonsensical in ADG

Geometric Dynamics C. Udriste, 2012-12-06 Geometric dynamics is a tool for developing a mathematical representation of real world phenomena based on the notion of a field line described in two ways as the solution of any Cauchy problem associated to a first order autonomous differential system as the solution of a certain Cauchy problem associated to a second order conservative prolongation of the initial system The basic novelty of our book is the discovery that a field line is a geodesic of a suitable geometrical structure on a given space Lorentz-Udriste world force law In other words we create a wider class of Riemann-Jacobi Riemann-Jacobi-Lagrange or Finsler-Jacobi manifolds ensuring that all trajectories of a given vector field are

geodesics This is our contribution to an old open problem studied by H Poincare S Sasaki and others From the kinematic viewpoint of corpuscular intuition a field line shows the trajectory followed by a particle at a point of the definition domain of a vector field if the particle is sensitive to the related type of field Therefore field lines appear in a natural way in problems of theoretical mechanics fluid mechanics physics thermodynamics biology chemistry etc **The British National**
