New Concepts In Aids Pathogenesis:

New Concepts in AIDS Pathogenesis Luc Montagnier, Marie-Lise Gougeon, 1993-08-02 This resource offers comprehensive explanations of current theories on the pathogenesis of AIDS examining in detail current data on the role that HIV and its possible cofactors play in the decline of immune system function and the progressive depletion of T lymphocytes. Information is provided on mycoplasmas as a potentially critical component in virus replication and immune activation. Revealing research studies in support of the theoretical approaches presented in this volume update the mechanisms of HIV latency and activation of expression at both the viral and cellular levels in the human and primate systems. It emphasizes the role of cytokines in the dysfunction of the immune and central nervous systems, describes the mechanisms of immune activation that result in anergy and programmed cell death involving the viral external glycoprotein and possible other foreign antigens or superantigens, and explicates original hypotheses on pathogenesis where virus glycoproteins may mimic allogenic stimulation and disturb the immune system network. This reference is intended for immunologists, infectious disease specialists, microbiologists, virologists, molecular and cell biologists, parasitologists, and pathologists. *Cumulated Index Medicus*, 1986. AIDS Research at EC Level Andre E. Baert, 1995 At EC level the fight against AIDS, one of the major health problems and socioeconomic diseases today, is also part of the specific RTD programme in the field of biomedicine and health. About 600 research teams are collaborating within 30 concerted actions networks that are underpinned by centralised facilities. For example, the epidemiology research networks are monitored by the WHO EC collaborating centre in St Maurice, France. Common experiments on animal models, antiviral screening, genetic analysis of multiple virus strains, and provision of reagents for vaccine development are also centralized facilities in AIDS research carried out under the principles of subsidiarity and Community added value. This publication presents an overview of their ongoing research activities in disease control and prevention: virology, immunological research, clinical research, and vaccine development. Covered by Current Contents Life Sciences, ISI volume 38 no 19 May 1995 p 11-12. Therefore, for anyone doing AIDS research, this is a must volume to have in order to understand what the European Community is doing in AIDS research.
