The Moon in the Post-Apollo Era Zdenek Kopal, 2012-12-06 The aim of the present book will be to summarize the results of the space exploration of the Moon in the past fifteen years culminating in the manned Apollo missions of 1969 1972 on the background of our previous acquaintance with our satellite made in the past by astronomical observations at a distance Astronomy is one of the oldest branches of science conceived by the inquisitive human mind though until quite recently it had been debarred from the status of a genuine experimental science by the remoteness of the objects of its study With the sole exception of meteoritic matter which occasionally finds its way into our laboratories all celestial bodies could be investigated only at a distance namely from the effects of attraction exerted by their mass or from the ciphered messages of their light carried by nimble footed photons across the intervening gaps of space A dramatic emergence of long range spacecraft capable of carrying men with their instruments not only outside the confines of our atmosphere but to the actual surface of our nearest celestial neighbour has since 1957 thoroughly changed this time honoured picture In particular as we shall detail in Chapter 1 of this book space astronomy of the Moon is barely 15 years old But relative infant as it is by age it has already provided us with such a tremendous amount of new and previously inaccessible scientific data as to virtually revolutionize our subject

The Guide to Nature, 1926 *Journal de la Société Royale D'astronomie Du Canada* Royal Astronomical Society of Canada, 1921 Library catalogue in 1911 31 p appended to v 4 *Earth-Moon Relationships* Cesare Barbieri, Francesca Rampazzi, 2013-06-29 Sediments and sedimentary processes on the Moon and Earth are very different In the absence of water an atmosphere the magnetosphere and much less oxygen in its rocks the Moon has neither clay minerals nor carbonates and no Fe₃ Mechanical weathering by impacts is the principal process of sediment generation on the Moon on Earth chemical weathering predominates Whereas processes of sediment transport are principally ballistic on the Moon movement by air water and ice prevail on the Earth The radical differences between Earth and Moon sediments make them useful end members between which all sediments of all terrestrial planetary bodies are expected to lie The purpose of this paper is 1 to compare and contrast major characteristics of the origin transportation deposition and preservation of sediments especially dust in the Earth and the Moon and 2 to suggest how sediments of other rocky planetary bodies especially Mars may fit in between the sediments of the Earth and the Moon

A favourable reception of the first edition of this book due no doubt to the nature of its subject which went out of print in 2 years gave its author a welcome opportunity to update at present its contents This was all the more necessary as seldom in the annals of science has our knowledge of the physics and astronomy of the Moon made greater progress than during this time The real heroes of this advance have of course been the spacecraft 33 of which have now been sent out since 1959 to reconnoiter our satellite at a close range The hard landers among them just about delivered their message by the time when the first edition of this book went to the press but it was the soft landers and orbiters which followed in their wake between 1966 67 that became really the principal contributors to lunar research By now that it may be both timely and their programmes have likewise been completed so opportune to take stock of the present state of our subject now on the eve of the next stage of lunar exploration by manned landings on the surface of our satellite which can be expected to take place in the very near future The aim of the second edition of this book will be to provide the requisite information brought up to date in an organized manner **The Cambridge Guide to the Solar System** Kenneth R. Lang,2003-09-25 The Cambridge

Guide to the Solar System provides a comprehensive and up to date description of the planets and their moons Writing at an introductory level appropriate for high school and undergraduate students Professor Lang leads the reader on a fascinating journey of exploration to the worlds beyond our home planet Earth The book begins with a short introduction to the history of planetary observation and discovery The major planets and their moons are then introduced by presenting common properties processes and themes This is followed by chapters which focus on individual planets and other solar system objects including a comprehensive treatment of the various space missions from the Apollo missions to the Moon to recent missions to Jupiter and Mars Filled with vital facts and information and lavishly illustrated in colour throughout this book will also appeal to professionals as well as general readers with an interest in planetary science **The Planets** David

McNab,James Younger,1999-01-01 A companion to the television series covers such topics as the discovery of Pluto the Orion nebula and the Viking space missions **The Story of the Heavens** Robert Stawell Ball,1891 The Story of the Heavens
