## **Seawater Aquariums The Captive Environment:**

**Seawater Aquariums** Stephen Spotte, 1979-09-07 Aquariology occupies a position that is peripheral to the main body of science. More specialized disciplines, such as ichthyology, provide the foundation for what is known about how aquatic animals and plants live in captive environments. The gap separating specialists from aquarists has never been adequately spanned until now. For the first time, material from these specialized fields has been assimilated, collated, and made available to aquarists. **SEAWATER AQUARIUMS** is the most comprehensive book of its kind ever written. Drawing on his own experiences in the public aquarium profession, Spotte deals with the maintenance of aquatic animals and plants in closed systems, aquariums in which the water is filtered and otherwise treated and then reused. Aquatic organisms alter the water in which they live, and their well-being is in turn affected by the extent and nature of the changes. Thus, the book's primary theme is the control of water quality factors that affect the physiological processes of captive seawater organisms. Among the topics discussed in detail are temperature control, lighting, aeration, buffering, bacteriological filtration, the workings of ultraviolet sterilizers and ozonators, physical adsorption methods, techniques for processing large volumes of influent seawater, and the origins and physiological effects of stress. The subject of the last chapter is the laboratory analysis of aquarium seawater. Both practical and theoretical aspects are integrated throughout the text, resulting in a unique blend of the latest theoretical information with practical techniques for using it. The accompanying bibliography is the most complete compendium of aquarium literature assembled to date. Researchers in freshwater, estuarine, and marine science, design engineers of public aquariums, hatcheries, aquaculture installations, and marine laboratories, oceanographic technicians, and public aquarium curators will all appreciate the usefulness of this unique volume on seawater aquarium technology.

**Captive Seawater Fishes** Stephen Spotte, 1992 Describes water chemistry, technology, and the biological and physical processes of the aquarium ecosystem. Additionally, it presents fish physiology, nutrition, diseases, and health maintenance. Provides usable methods and specific protocols for keeping marine fish, with the emphasis on professional approaches for public aquariums.

**Environmental Impacts of Aquaculture** Kenneth D. Black, 2001 The continued expansion of aquaculture in a wide range of environments and of a growing number of species has led to increasing demands on aquatic resources These demands vary with the culture species the culture method and the environmental and ecological setting While there are many examples of efforts to mitigate detrimental environmental effects the environment remains the ultimate constraint on the future sustainable development of this maturing industry The relationships between the activities of aquaculture and the environment are therefore of economic importance as well as of scientific interest and for these reasons a large international research community has developed over the past decade In this volume the resultant research is synthesised and critically reviewed providing a source of reference to the most important recent developments at research and professional level The authors are internationally recognised authorities who have made significant contributions to their respective research areas The first part of the volume is organised in terms of the major culture types This is followed by chapters of general relevance to aquaculture The volume is designed to complement *Biology of Farmed Fish* eds K D Black A D Pickering also published in this series It is directed at fish biologists shellfish biologists and environmental scientists working in the academic governmental and industrial sectors *Technical Bulletin*, 1998
