Oswalt, 2012-12-06 The motivation for these volumes is to provide a vision for the future of small telescopes While this is an admirable task ultimately I believe that as happens all the time in science the prognostications will be overtaken by a rapidly changing scientific reality As Virginia Trimble points out in chapter 1 the kinds of big questions

that face us as astronomers today are rather different than the ones that drove the construction of astronomical facilities through much of the twentieth century. Right now it appears that small telescopes will not have a lot of influence in answering those questions though they will of course contribute enormously to the many issues discussed throughout the three volumes. We are on the verge of opening a whole new parameter space that may revolutionize the way we think of small telescopes and their role in astronomy: the domain of the rapidly variable sky. While the LSST is the most prominent example it is a long way in the future. Nemiroff & Rafert, chapter 2, consider the value of monitoring large parts of the sky on a continuous basis using technology similar to a webcam. They have installed their CONCAM2 at four locations including Kitt Peak. A related project built and operated by the Harvard graduate student Gaspar Bakos, HAT-1, Hungarian Automated Telescope, also is in operation at Kitt Peak.

The Future of Small Telescopes in the New Millennium: The telescopes we use Terry D. Oswalt, 2003. This title details the essential roles that small telescopes should play in 21st century science and how their future productivity can be maximized. Over 70 experts from all corners of the international astronomical community have created a reference on the future of big science with small telescopes at national facilities and their omission from national science priority studies. The oft-lamented demise of the small telescope has been greatly exaggerated. In fact the future of these workhorses of astronomy will be brighter than ever if creative steps are taken now. This three-volume set defines essential roles that small telescopes should play in 21st century science and the ways in which a productive future for them can be realized. A wide cross-section of the astronomical community has contributed to a definitive assessment of the present and a vision for the future. Radio and space-based facilities face problems in scientific prioritization and funding. It highlights how current small facilities are evolving to meet the scientific priorities and economical realities of the 21st century through standardization of instrumentation, use of off-the-shelf technology, specialization, optical improvements, new modes of scheduling, automation, and internet access.

Observational Cosmology M.N. Bremer, N. Jackson, I. Pérez-Fournon, 2012-12-06. Radio surveys play an important role in observational cosmology. However, until recently the surveys have been either of wide area but with low sensitivity or of small area with high sensitivity. Both limit the kinds of cosmology that can be carried out with radio surveys. This situation has been revolutionised in the past few years by the availability of new large area high sensitivity radio surveys at both low and high radio frequencies. These significant improvements allow studies based on both the statistics of the surveys themselves and multiwavelength follow-up of the galaxies and AGN responsible for the radio emission. It is therefore an opportune time to summarise progress in this field with a workshop. This book comprises the proceedings of the Observational Cosmology with the New Radio Surveys workshop held on Tenerife, January 13-15, 1997. Topics covered include lessons learned and important results from earlier surveys, descriptions of some of the new surveys, clusters of galaxies and large-scale structure, radio source evolution, CMB studies, gravitational lensing, and multiwavelength studies of distant radio sources.
