Semantic Search over the Web Roberto De Virgilio,Francesco Guerra,Yannis Velegrakis,2012-08-04 The Web has become the world s largest database with search being the main tool that allows organizations and individuals to exploit its huge amount of information Search on the Web has been traditionally based on textual and structural similarities ignoring to a large degree the semantic dimension i e understanding

the meaning of the query and of the document content Combining search and semantics gives birth to the idea of semantic search Traditional search engines have already advertised some semantic dimensions Some of them for instance can enhance their generated result sets with documents that are semantically related to the query terms even though they may not include these terms Nevertheless the exploitation of the semantic search has not yet reached its full potential In this book Roberto De Virgilio Francesco Guerra and Yannis Velegrakis present an extensive overview of the work done in Semantic Search and other related areas They explore different technologies and solutions in depth making their collection a valuable and stimulating reading for both academic and industrial researchers The book is divided into three parts The first introduces the readers to the basic notions of the Web of Data It describes the different kinds of data that exist their topology and their storing and indexing techniques The second part is dedicated to Web Search It presents different types of search like the exploratory or the path oriented alongside methods for their efficient and effective implementation Other related topics included in this part are the use of uncertainty in query answering the exploitation of ontologies and the use of semantics in mashup design and operation The focus of the third part is on linked data and more specifically on applying ideas originating in recommender systems on linked data management and on techniques for the efficiently querying answering on linkeddata

Structure Howard Lasnik, Juan Uriagereka, 2022-12-13 Natural phenomena including human language are not just series of events but are organized quasi periodically sentences have structure and that structure matters Howard Lasnik and Juan Uriagereka were there when generative grammar was being developed into the Minimalist Program In this presentation of the universal aspects of human language as a cognitive phenomenon they rationally reconstruct syntactic structure In the process they touch upon structure dependency and its consequences for learnability nuanced arguments including global ones for structure presupposed in standard linguistic analyses and a formalism to capture long range correlations For practitioners the authors assess whether all we need is Merge while for outsiders they summarize what needs to be covered when attempting to have structure emerge Reconstructing the essential history of what is at stake when arguing for sentence scaffolding the authors cover a range of larger issues from the traditional computational notion of structure the strong generative capacity of a system and how far down into words it reaches to whether its variants as evident across the world's languages can arise from non generative systems While their perspective stems from Noam Chomsky's work it does so critically separating rhetoric from results They consider what they do to be empirical with the formalism being only a tool to guide their research of course they want sharp tools that can be falsified and have predictive power Reaching out to skeptics they invite potential collaborations that could arise from mutual examination of one another's work as they attempt to establish a dialogue beyond generative grammar
