Statistical Methods for Trend Detection and Analysis in the Environmental Sciences Richard Chandler, Marian Scott, 2011-03-25 The need to understand and quantify change is fundamental throughout the environmental sciences This might involve describing past variation understanding the mechanisms underlying observed changes making projections of possible future change or monitoring the effect of intervening in some environmental system This book provides an overview of modern statistical techniques that may be relevant in problems of this nature Practitioners studying environmental change will be familiar with many classical statistical procedures for the detection and estimation of trends However the ever increasing capacity to collect and process vast amounts of environmental information has led to growing awareness that such procedures are limited in the insights that they can deliver At the same time significant developments in statistical

methodology have often been widely dispersed in the statistical literature and have therefore received limited exposure in the environmental science community This book aims to provide a thorough but accessible review of these developments It is split into two parts the first provides an introduction to this area and the second part presents a collection of case studies illustrating the practical application of modern statistical approaches to the analysis of trends in real studies Key Features Presents a thorough introduction to the practical application and methodology of trend analysis in environmental science Explores non parametric estimation and testing as well as parametric techniques Methods are illustrated using case studies from a variety of environmental application areas Looks at trends in all aspects of a process including mean percentiles and extremes Supported by an accompanying website featuring datasets and R code The book is designed to be accessible to readers with some basic statistical training but also contains sufficient detail to serve as a reference for practising statisticians It will therefore be of use to postgraduate students and researchers both in the environmental sciences and in statistics

Improving Natural Resource Management Timothy C. Haas, 2011-01-13 The decision to implement environmental protection options is a political one These and other political and social decisions affect the balance of the ecosystem and how the point of equilibrium desired is to be reached This book develops a stochastic temporal model of how political processes influence and are influenced by ecosystem processes and looks at how to find the most politically feasible plan for managing an at risk ecosystem Finding such a plan is accomplished by first fitting a mechanistic political and ecological model to a data set composed of observations on both political actions that impact an ecosystem and variables that describe the ecosystem The parameters of this fitted model are perturbed just enough to cause human behaviour to change so that desired ecosystem states occur This perturbed model gives the ecosystem management plan needed to reach desired ecosystem states To construct such a set of interacting models topics from political science ecology probability and statistics are developed and explored Key features Explores politically feasible ways to manage at risk ecosystems Gives agent based models of how social groups affect ecosystems through time Demonstrates how to fit models of population dynamics to mixtures of wildlife data Presents statistical methods for fitting models of group behaviour to political action data Supported by an accompanying website featuring datasets and JAVA code This book will be useful to managers and analysts working in organizations charged with finding practical ways to sustain biodiversity or the physical environment Furthermore this book also provides a political roadmap to help lawmakers and administrators improve institutional environmental management decision making

Review of EPA's Integrated Risk Information System (IRIS) Process National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Committee to Review the IRIS Process, 2014-06-25

The Integrated Risk Information System IRIS is a program within the US Environmental Protection Agency EPA that is responsible for developing toxicologic assessments of environmental contaminants An IRIS assessment contains hazard identifications and dose response assessments of various chemicals related to cancer and noncancer outcomes Although the program was created to increase consistency among toxicologic assessments within the agency federal state and international agencies and other organizations have come to rely on IRIS assessments for setting regulatory standards establishing exposure guidelines and estimating risks to exposed populations Over the last decade the National Research Council NRC has been asked to review some of the more complex and challenging IRIS assessments including those of formaldehyde dioxin and tetrachloroethylene In 2011 an NRC committee released its review of the IRIS formaldehyde assessment Like other NRC committees that had reviewed IRIS assessments the formaldehyde committee identified deficiencies in the specific assessment and more broadly in some of EPA's general approaches and specific methods Although the committee focused on evaluating the IRIS formaldehyde assessment it provided suggestions for improving the IRIS process and a roadmap for its revision in case EPA decided to move forward with changes to the process Congress directed EPA to implement the report's recommendations and then asked the National Research Council to review the changes that EPA was making or proposing to make in response to the recommendations

Review of EPA's Integrated Risk Information System IRIS Process provides an overview of some general issues associated with IRIS assessments This report then addresses evidence identification and evaluation for IRIS assessments and discusses evidence integration for hazard evaluation and methods for calculating reference values and unit risks The report makes recommendations and considerations for future directions Overall *Review of EPA's Integrated Risk Information System Process* finds that substantial improvements in the IRIS process have been made and it is clear that EPA has embraced and is acting on the recommendations in the NRC formaldehyde report The recommendations of this report should be seen as building on the progress that EPA has already made
