of Complex Systems Vijay Kumar Mago, Vahid Dabbaghian, 2013-10-31 Computational and mathematical models provide us with the opportunities to investigate the complexities of real world problems They allow us to apply our best analytical methods to define problems in a clearly mathematical manner and exhaustively test our solutions before committing expensive resources This is made possible by assuming parameter s in a bounded environment allowing for controllable experimentation not always possible in live scenarios For example simulation of computational models allows the testing of theories in a manner that is both fundamentally deductive and experimental in nature The main ingredients for such research ideas come from multiple disciplines and the importance of interdisciplinary research is well recognized by the scientific community This book provides a window to the novel endeavours of the research communities to present their works by highlighting the value of computational modelling as a research tool when investigating complex systems We hope that the readers will have stimulating experiences to pursue research in these directions **Smart Modeling and Simulation for**

The Role of Model Integration in Complex Systems Modelling Manish Patel, Sylvia Nagl, 2014-10-15

Model integration the process by which different modelling efforts can be brought together to simulate the target system is a core technology in the field of Systems Biology In the work presented here model integration was addressed directly taking cancer systems as an example An in depth literature review was carried out to survey the model forms and types currently being utilised This was used to formalise the main challenges that model integration poses namely that of paradigm the formalism on which a model is based focus the real world system the model represents and scale A two tier model integration strategy including a knowledge driven approach to address model semantics was developed to tackle these challenges In the first step a novel description of models at the level of behaviour rather than the precise mathematical or computational basis of the model is developed by distilling a set of abstract classes and properties These can accurately describe model behaviour and hence describe focus in a way that can be integrated with behavioural descriptions of other models In the second step this behaviour is decomposed into an agent based system by translating the models into local interaction rules The book provides a detailed and highly integrated presentation of the method encompassing both its novel theoretical and practical aspects which will enable the reader to practically apply it to their model integration needs in academic research and professional settings The text is self supporting It also includes an in depth current bibliography to relevant research papers and literature The review of the current state of the art in tumour modelling provides added value
