Modelling Frequency And Count Data:

Modelling Frequency and Count Data J. K. Lindsey,1995-04-27 Categorical data analysis is a special area of generalised linear models which has become the most important area of statistical applications in many disciplines from medicine to social sciences This text presents the standard models and many newly developed ones in a language which can be immediately applied in many modern statistical packages such as GLIM GENSTAT S Plus as well as SAS and LISP STAT The book is structure around the distinction between independent events occurring to different individuals resulting in frequencies and repeated events occurring to the same individuals yielding counts The book demonstates that much of modern statistics can be seen as special cases of categorical data models both generalized linear models and proportional hazards models can be fitted as log linear models More specialized topics such as Markov chains overdispersion and random effects are also covered **Modelling Frequency and Count Data** James K. Lindsey, Regression Models for Categorical and Count Data Peter Martin,2022-03-01 This text provides practical guidance on conducting regression analysis on categorical and count data Step by step and supported by lots of helpful graphs it covers both the theoretical underpinnings of these methods as well as their application giving you the skills needed to apply them to your own research It offers guidance on Using logistic regression models for binary ordinal and multinomial outcomes Applying count regression including Poisson negative binomial and zero inflated models Choosing the most appropriate model to use for your research The general principles of good statistical modelling in practice Part of The SAGE Quantitative Research Kit this book will give you the know how and confidence needed to succeed on your quantitative research journey *Applying Generalized Linear Models* James K. Lindsey,2008-01-15 Applying Generalized Linear Models describes how generalized linear modelling procedures can be used for statistical modelling in many different fields without becoming lost in problems of statistical inference Many students even in relatively advanced statistics courses do not have an overview whereby they can see that the three areas linear normal categorical and survival models have much in common The author shows the unity of many of the commonly used models and provides the reader with a taste of many different areas such as survival models time series and spatial analysis This book should appeal to applied statisticians and to scientists with a basic grounding in modern statistics With the many exercises included at the ends of chapters it will be an excellent text for teaching the fundamental uses of statistical modelling The reader is assumed to have knowledge of basic statistical principles whether from a Bayesian frequentist or direct likelihood point of view and should be familiar at least with the analysis of the simpler normal linear models regression and ANOVA The author is professor in the biostatistics department at Limburgs University Diepenbeek in the social science department at the University of Li ge and in medical statistics at DeMontfort University Leicester He is the author of nine other books *Confidence Intervals in Generalized Regression Models* Esa Uusipaikka,2008-07-25 A Cohesive Approach to Regression Models Confidence Intervals in Generalized Regression Models introduces a unified

Preference Data for Environmental Valuation John Whitehead,Tim Haab,Ju-Chin Huang,2012-03-15 The monetary valuation of environmental goods and services has evolved from a fringe field of study in the late 1970s and early 1980s to a primary focus of environmental economists over the past decade Despite its rapid growth practitioners of valuation techniques often find themselves defending their practices to both users of the results of applied studies and perhaps more troubling to other practitioners One of the more heated threads of this internal debate over valuation techniques revolves around the types of data to use in performing a valuation study In the infant years of the development of valuation techniques two schools of thought emerged the revealed preference school and the stated preference school the latter of which is

perhaps most associated with the contingent valuation method In the midst of this debate an exciting new approach to non market valuation was developed in the 1990s a combination and joint estimation of revealed preference and stated preference data There are two primary objectives for this book One objective is to fill a gap in the nonmarket valuation primer literature A number of books have appeared over the past decade that develop the theory and methods of nonmarket valuation but each takes an individual nonmarket valuation method approach This book considers each of these valuation methods in combination with another method These relationships can be exploited econometrically to obtain more valid and reliable estimates of willingness to pay relative to the individual methods The second objective is to showcase recent and novel applications of data combination and joint estimation via a set of original state of the art studies that are contributed by leading researchers in the field This book will be accessible to economists and consultants working in business or government as well as an invaluable resource for researchers and students alike **Analyzing Categorical Data** Jeffrey S. Simonoff,2013-06-05 Categorical data arise often in many fields including biometrics economics management manufacturing marketing psychology and sociology This book provides an introduction to the analysis of such data The coverage is broad using the loglinear Poisson regression model and logistic binomial regression models as the primary engines for methodology Topics covered include count regression models such as Poisson negative binomial zero inflated and zero truncated models loglinear models for two dimensional and multidimensional contingency tables including for square tables and tables with ordered categories and regression models for two category binary and multiple category target variables such as logistic and proportional odds models All methods are illustrated with analyses of real data examples many from recent subject area journal articles These analyses are highlighted in the text and are more detailed than is typical providing discussion of the context and background of the problem model checking and scientific implications More than 200 exercises are provided many also based on recent subject area literature Data sets and computer code are available at a web site devoted to the text Adopters of this book may request a solutions manual from textbook springer ny com From the reviews Jeff Simonoff s book is at the top of the heap of categorical data analysis textbooks The examples are superb Student reactions in a class I taught from this text were uniformly positive particularly because of the examples and exercises Additional materials related to the book particularly code for S Plus SAS and R useful for analysis of examples can be found at the author s Web site at New York University I liked this book for this reason and recommend it to you for pedagogical purposes Stanley Wasserman The American Statistician August 2006 Vol 60 No 3 The book has various noteworthy features The examples used are from a variety of topics including medicine economics sports mining weather as well as social aspects like needle exchange programs The examples motivate the theory and also illustrate nuances of data analytical procedures The book also incorporates several newer methods for analyzing categorical data including zero inflated Poisson models robust analysis of binomial and poisson models sandwich estimators multinomial smoothing ordinal agreement tables this is definitely a good

out of notes prepared by the author for classes in categorical data analysis The presentation is fresh and compelling to read Regression ideas are used to motivate the modelling presented The book focuses on applying methods to real problems many of these will be novel to readers of statistics texts All chapters end with a section providing references to books or articles for the inquiring reader C M O Brien Short Book Reviews Vol 23 3 2003   <u>Applied Smoothing Techniques for Data Analysis</u> Adrian W. Bowman,Adelchi Azzalini,1997-08-14 The book describes the use of smoothing techniques in statistics including both density estimation and nonparametric regression Considerable advances in research in this area have been made in recent years The aim of this text is to describe a variety of ways in which these methods can be applied to practical problems in statistics The role of smoothing techniques in exploring data graphically is emphasised but the use of nonparametric curves in drawing conclusions from data as an extension of more standard parametric models is also a major focus of the book Examples are drawn from a wide range of applications The book is intended for those who seek an introduction to the area with an emphasis on applications rather than on detailed theory It is therefore expected that the book will benefit those attending courses at an advanced undergraduate or postgraduate level as well as researchers both from statistics and from other disciplines who wish to learn about and apply these techniques in practical data analysis The text makes extensive reference to S Plus as a computing environment in which examples can be explored S Plus functions and example scripts are provided to implement many of the techniques described These parts are however clearly separate from the main body of text and can therefore easily be skipped by readers not interested in S Plus   **Time Series** Peter Diggle,2024-12-24 Time series analysis is one of several branches of statistics whose practical importance has increased with the availability of powerful computational tools Methodology that was originally developed for specialized applications for example in finance or geophysics is now widely available within general statistical packages The second edition of Time Series A Biostatistical Introduction is an introductory account of time series analysis written from the perspective of applied statisticians whose interests lie primarily in the biomedical and health sciences This edition has a stronger focus on substantive applications in which each statistical analysis is directed at a specific research question Separate chapters cover simple descriptive methods of analysis including time plots smoothing the correlogram and the periodogram theory of stationary random processes discrete time models for single series continuous time models for single series generalized linear models for time series of counts models for replicated series spectral analysis and bivariate time series The book is unique in its focus on biomedical and health science applications which has been strengthened in this second edition Nevertheless the methods described are more widely applicable It should be useful to teachers and students on masters level degree courses in statistics biostatistics and epidemiology and to biomedical and health scientists with a knowledge of statistical methods at undergraduate level Throughout examples based on real datasets show a close interplay between statistical method and substantive science This book will also describe the implementation of the methods in the R computing environment and provide access to R code and
