Rots, 2022-05-22 Computational Modelling of Concrete and Concrete Structures contains the contributions to the EURO C 2022 conference Vienna Austria 23-26 May 2022. The papers review and discuss research advancements and assess the applicability and robustness of methods and models for the analysis and design of concrete fibre reinforced and prestressed concrete structures as well as masonry structures. Recent developments include methods of machine learning, novel discretisation methods, probabilistic models and consideration of a growing number of micro structural aspects in multi scale and multi physics settings. In addition, trends towards the material scale with new fibres and 3D printable concretes and life cycle oriented models for ageing and durability of existing and new concrete infrastructure are clearly visible. Overall, computational robustness of numerical predictions and mathematical rigour have further increased, accompanied by careful model validation based on respective experimental programmes. The book will serve as an important reference for both academics and professionals, stimulating new research directions in the field of computational modelling of concrete and its application to the analysis of concrete structures. EURO C 2022 is the eighth edition of the EURO C conference series after Innsbruck 1994, Bad Gastein 1998, St Johann im Pongau 2003, Mayrhofen 2006, Schladming 2010, St Anton am Arlberg 2014 and Bad Hofgastein 2018. The overarching focus of the conferences is on computational methods and numerical models for the analysis of concrete and concrete structures. *Small-Scale Models of Concrete Structures* Richard N. Engineers, 1964 **Design Examples for Strut-and-tie Models** fib Fédération internationale du béton, 2011 fib Bulletin 61 is a continuation of fib Bulletin 16, 2002. Again, the bulletin's main objective is to demonstrate the application of the FIP Recommendations for the Practical Design of Structural Concrete and especially to illustrate the use of strut and tie models to design discontinuity regions. D regions in concrete structures. Bulletin 61 presents 14 examples, most of which are existing structures built in recent years. Although some of the presented structures can be considered to be quite important and in

some instances complex the chosen examples are not intended to be exceptional The main aim is to look at specific design aspects by selecting D regions of the presented structures that are designed and detailed according to the proposed design principles and specifications for the use of strut and tie models Two papers at the end of the bulletin deal with the role of concrete tension fields in modelling with strut and tie models and summarize the experiences gained by the Working Group in applying strut and tie models to the examples in the bulletin It is hoped that fib Bulletin 61 will be of interest to engineers involved in the design of concrete structures supporting the use of more consistent design and detailing tools such as strut and tie models
