Concentric zone model

- Central business district
- Factory zone
- Zone of transition
- Zone of working men's homes
- Residential zone
- Commuters' zone

Land use is arranged in a series of concentric rings or zones around the city centre. The idea is that the city has grown outward in all directions from the centre, adding new buildings around the edges. The process is rather like the growth rings of trees. It means that the urban fabric should get older towards the centre. The width of the zones varies according to the density of building.

Sector model

- Central business district
- Wholesale light manufacturing
- Low-class residential
- Medium-class residential
- High-class residential

Land use is arranged in wedges or sectors which radiate from the city centre. Growth follows a linear pattern along major transport routes or physical features such as river valleys. We assume that once a particular type of land use establishes itself in an area, it attracts similar activities (like industry) and repels dissimilar ones (like high-status housing).

Multiple nuclei model

- Central business district
- Wholesale and light manufacturing
- Low-class residential
- Medium-class residential
- High-class residential
- Heavy manufacturing
- Outlying business district
- Industrial suburb

Distinctive land uses form small areas or nuclei such as the central business district, housing estates, industrial estates, and office and retail parks. Often similar activities/types of land use benefit from being clustered together.
