**Modern Aspects of Graphite Technology** Lionel Cyril Francis Blackman, 1970      **Graphite and Precursors** Pierre Delhaes, 2000-12-21 Humans first used carbon as chars from firewood in ritual paintings and primitive metallurgical processes Natural forms of carbon have been known since antiquity yet the knowledge of the carbon element in chemistry and its technical applications on a larger scale are a relatively recent development The industrial revolution in Europe two centuries ago led the way to the numerous applications of these graphitic forms that are still used today Graphite and Precursors features short tutorial articles on different topics related to the science and technology of carbons intended for engineers students of Materials Science and scientists who are seeking a fundamental understanding without reinventing the wheel This first volume of the World of Carbon book series focuses on graphite and its precursors including its origin and various implications The basic properties of hexagonal graphite are developed and several theoretical and experimental approaches explain why this crystalline solid is fascinating in solid state physics Also featured are the numerous applications connected to thermal mechanical and chemical graphites as well as their various industrial uses in polycrystalline form Finally carbon precursors are introduced      **Modern Aspects of Graphite Technology** Blackman LCF Ed, 1970

**Fundamental Issues in Control of Carbon Gasification Reactivity** L Lahaye, Pierre Ehrburger, 2012-12-06 During the last decade there has been a renewed interest in understanding from a fundamental point of view the gasification of carbon Basi cally there are two major issues in controlling the reactivity of carbon i reduction of the gasification rate of carbon materials in hostile environment ii increase of the gasification rate in order to utilize carbonaceous compounds more effectively Although these two objectives look

somewhat contradictory they are part of the general topics of understanding gasification reactivity of carbon Refractory applications of carbon in furnace linings seals and vanes as well as the use of carbon carbon or carbon ceramic composites in structures able to withstand corrosion at high temperature require a better understanding of the fundamentals involved in carbon oxidizing gas  $2\text{CO} + \text{H}_2\text{O}$  reactions Furthermore a great interest of aluminium producers is extending the lifetime of carbon electrodes in alumina electrolysis which primarily depends on reducing their consumption rates by air or carbon dioxide Proper control of gasification reactions is also of prime importance in manufacturing carbonaceous adsorbents like granular activated carbon clothes of high adsorption characteristics The balance between increase of porosity and decrease in mechanical strength during activation is critical for developing new porous types of carbon materials in particular for carbon clothes and this can only be achieved by a careful control of the gasification reaction

**Preparation and Crystal Growth of Materials with Layered Structures** R.M.A. Lieth, 2013-06-29 The goal of the series Physics and Chemistry of Materials with Layered Structures is to give a critical survey of our present knowledge on a large family of materials which can be described as solids containing molecules which in two dimensions extend to infinity and which are loosely stacked on top of each other to form three dimensional crystals Of course the physics and chemistry of these crystals are specific chapters in ordinary solid state science and many a scientist hunting for new phenomena has in the past been disappointed to find that materials with layered structures are not entirely exotic Their electron and phonon states are not two dimensional and the high hopes held by some for spectacular dimensionality effects in superconductivity were shattered Nevertheless the structural features and their physical and chemical consequences singularize layered structures sufficiently to make them a fascinating subject of research This is all the more true since they are met in insulators and semiconductors as well as in normal and superconducting metals Although for the time being the series is intentionally limited to cover inorganic materials only the many known organic layered structures may well be the subject of future volumes Among the noteworthy peculiarities of layered structures we mention specific growth mechanisms and crystal habits Polytypism is very common and it is fascinating indeed to find up to 240 different polytypes in the same chemical substance
