Davies,M.J. Valente Neves,2012-12-06 Challenging problems involving jet and plume phenomena are common to many areas of fundamental and applied scientific research and an understanding of plume and jet behaviour is essential in many geophysical and industrial contexts For example in the field of meteorology where pollutant dispersal takes place by means of atmospheric jets and plumes formed either naturally under conditions of convectively driven flow in the atmospheric boundary layer or anthropogenically by the release of pollutants from tall chimneys In other fields of geophysics buoyant plumes and jets are known to play important roles in oceanic mixing processes both at the relatively large scale as in deep water formation by convective sinking and at the relatively small scale as with plume formation beneath ice leads for example In the industrial context the performances of many engineering systems are determined primarily by the behaviour of buoyant plumes and jets For example i in sea outfalls where either sewage or thermal effluents are discharged into marine and or freshwater environments ii in solar ponds where buoyant jets are released under density interfaces iii in buildings where thermally generated plumes affect the air quality and ventilation properties of architectural environments iv in rotating machinery where fluid jet are used for cooling purposes and v in long road and rail tunnels where safety and ventilation procedures rely upon an understanding of the behaviour of buoyant jets In many other engineering and oceanographic contexts the properties of jets and plumes are of great importance **New Results in Numerical and Experimental Fluid Mechanics XII** Andreas Dillmann,Gerd Heller,Ewald Krämer,Claus Wagner,Cameron Tropea,Suad Jakirlić,2019-09-26 This book gathers contributions to the 21st biannual symposium of the German Aerospace Aerodynamics Association STAB and the German Society for Aeronautics and

Recent Advances in Computational Fluid Dynamics C.C. Chao, Steven A. Orszag, W. Shyy, 2013-03-07 From the preface Fluid dynamics is an excellent example of how recent advances in computational tools and techniques permit the rapid advance of basic and applied science The development of computational fluid dynamics CFD has opened new areas of research and has significantly supplemented information available from experimental measurements Scientific computing is directly responsible for such recent developments as the secondary instability theory of transition to turbulence dynamical systems analyses of routes to chaos ideas on the geometry of turbulence direct simulations of turbulence three dimensional full aircraft flow analyses and so on We believe that CFD has already achieved a status in the tool kit of fluid mechanicians equal to that of the classical scientific techniques of mathematical analysis and laboratory experiment

Giaoutzi,2017-05-15 Tourist visits used to be a less common activity in the past However more people than ever now make leisure trips making this an era of mass tourism This drastic change in spatial behaviour is not only caused by economic prosperity but the scale of this phenomenon means that it is able to generate economic growth making tourism a key factor in regional development policy One of the main challenges of current regional policy is to market the attractiveness of an area thereby increasing tourist visits and subsequent revenue In particular regions are attempting this through the use of Information and Communication Technologies ICT which offer information on interesting places and efficient methods for organizing and booking trips This book examines the interconnections between tourism ICT and regional development Bringing together a range of European case studies illustrating various ICT and policy innovations it not only critiques current activity by regions in terms of tourism development but also considers how this sector is likely to continue to grow

Strömungsmechanik I C.A. Truesdell, 2012-12-06 343 Whilst this may be so it is also true that this in itself is not sufficient to determine it completely In fact the extent of the dead air region and the behaviour of the shear layer are also of prime importance and in short a unified treatment comprising external flow boundary layer shear layer and dead air region becomes necessary to complete the investigation This would take us outside the scope of the present article and for the substantial progress that has been made towards such a treatment the reader is referred to a paper by HOLDER and GADD 1 and its comprehensive list of references v Heat transfer in incompressible boundary layers 25 Introduction The term fluid includes gases and liquids Both gases and liquids are to some extent compressible but in many problems of fluid flow the density changes occurring are small When they are small enough to be negligible we can regard the flow as incompressible In Chap IV we have established the equations for compressible flow of gases and these can of course be used to determine when density changes in a gas flow are in fact negligible Broadly speaking this will be so when the temperature changes as determined by the energy equation are small enough Landscape Erosion and Evolution Modeling Russell S.

Harmon, William W. Doe III, 2012-12-06 Landscapes are characterized by a wide variation both spatially and temporally of tolerance and response to natural processes and anthropogenic stress These tolerances and responses can be analyzed through individual landscape parameters such as soils vegetation water etc or holistically through ecosystem or watershed studies However such approaches are both time consuming and costly Soil erosion and landscape evolution modeling provide a simulation environment in which both the short and long term consequences of land use activities and alternative land use strategies can be compared and evaluated Such models provide the foundation for the development of land management decision support systems Landscape Erosion and Evolution Modeling is a state of the art interdisciplinary volume addressing the broad theme of soil erosion and landscape evolution modeling from different philosophical and technical approaches ranging from those developed from considerations of first principle soil water physics and mechanics to those developed empirically according to sets of behavioral or empirical rules deriving from field observations and measurements The validation and calibration of models through field studies is also included This volume will be essential reading for researchers in earth environmental and ecosystem sciences hydrology civil engineering forestry soil science agriculture and

climate change studies In addition it will have direct relevance to the public and private land management communities
