Modern Methods In Carbohydrate Synthesis:

Modern Methods in Carbohydrate Synthesis Shaheer H. Khan, 1996-03-01 Modern Methods in Carbohydrate Synthesis presents in one volume a sequence of chapters leading from classical methods through to today's newest state of the art technology for oligosaccharide synthesis. It places particular emphasis on the most recent breakthroughs in the field including emerging technologies for both oligosaccharide and glycoconjugate synthesis. Chapters describing the synthesis of increasingly important glycosidic linkage analogs as well as the oligosaccharides containing derivatives and analogs of natural sugars are included. While chemical synthetic methods constitute the major part of the book, completing the volume is a section on the rapidly expanding and important field of enzymatic synthesis also covering combined chemical and enzymatic synthesis. Chapters are written by leading experts in the field. Wherever possible, methods of synthesis are provided in sufficient detail to allow the reader to implement the techniques described. More than 1700 references are provided in the 21 chapters comprising the book. This volume should provide a wealth of information to a large number of synthetic organic chemists, medicinal chemists, protein chemists, biochemists, glycobiologists, and cell biologists including students in these fields.

Glycosciences Hans-Joachim Gabius, Sigrun Gabius, 2008-09-26 A comprehensive survey of the topic ranging from basic molecular research to clinical applications. Critical reviews by leading experts in each field summarize the state of knowledge and discuss the anticipated benefits of novel approaches and strategies. These include the impact of modern analysis techniques on glycobiology, the use of synthetic neoglycoproteins, or the clinical consequences of new insights into the physiological role of lectins and glycoconjugates in pathology, oncology, immunity, neuroscience, and reproduction medicine. Throughout the aim is to separate realistic applications from mere hopes.

Glycoscience Arnold E. Stütz, 2003-07-01 This series presents critical reviews of the present position and future trends in modern chemical research. The short and concise reports on chemistry, each written by the world's renowned experts, are still valid and useful after 5 or 10 years.

Protecting Groups: Strategies and Applications in Carbohydrate Chemistry Sebastien Vidal, 2019-04-29 A unique overview of the most important protecting group strategies in carbohydrate chemistry. Protecting Groups: Strategies and Applications in Carbohydrate Chemistry provides a detailed account of key strategies and methodologies for the protection of carbohydrates. Divided into two parts, the first focuses on groups that are used best to protect a specific position on a carbohydrate. In the second part, specific carbohydrate residues or compounds are discussed in the context of a specific protecting group strategy used to reach the desired regioisomer. This important book features chapters on protecting groups at the primary and secondary positions of carbohydrates. Describes protecting group strategies towards sialic acid derivatives, glycofuranoses, sulfated glycosaminoglycans, and cyclodextrins. Provides information on automated glycan assembly. Includes a chapter on the industrial scale synthesis of heparin analogs. Written by a team of leaders in the field. Protecting Groups: Strategies and Applications in Carbohydrate Chemistry is an indispensable guide for academics and industrial researchers.

Combinatorial Peptide Library Protocols Shmuel Cabilly, 2008-02-02 During the course of evolution an imbalance was created between the rate of vertebrate genetic adaptation and that of the lower forms of living organisms such as bacteria and viruses This imbalance has given the latter the advantage of generating relatively quickly molecules with unexpected structures and features that carry a threat to vertebrates To compensate for their weakness vertebrates have accelerated their own evolutionary processes not at the level of whole organism but in specialized cells containing the genes that code for antibody molecules or for T cell receptors That is when an immediate requirement for molecules capable of specific interactions arose nature has preferred to speed up the mode of Darwinian evolution in preference to any other approach such as the use of X ray diffraction studies and computergraphic analysis Recently Darwinian rules have been adapted for test tube research and the concept of selecting molecules having particular characteristics from random pools has been realized in the form of various chemical and biological combinatorial libraries While working with these libraries we noticed the interesting fact that when combinatorial libraries of oligopeptides were allowed to interact with different selector proteins only the actual binding sites of these proteins showed binding properties whereas the rest of the protein surface seemed inert This seemingly common feature of protein having no extra potential binding sites was probably selected during evolution in order to minimize nonspecific interactions with the surrounding milieu **Carbohydrate-based Drug Discovery, 2**
