Abstract

The problem of transition to chaos, i.e. the destruction of invariant circles or KAM (Kolmogorov–Arnold–Moser) curves, in area preserving *nontwist* maps is studied within the renormalization group framework. Nontwist maps are maps for which the twist condition is violated along a curve known as the shearless curve. In renormalization language this problem is that of finding and studying the fixed points of the renormalization group operator \mathcal{R} that acts on the space of maps. A simple period-two fixed point of \mathcal{R} , whose basin of attraction contains the nontwist maps for which the shearless curve exists, is found. Also, a critical period-12 fixed point of \mathcal{R} , with two unstable eigenvalues, is found. The basin of attraction of this critical fixed point contains the nontwist maps for which the shearless curve is at the threshold of destruction. This basin defines a new universality class for the transition to chaos in area preserving maps.

1. Introduction

A fundamental problem of Hamiltonian dynamics is to understand the behavior of an integrable Hamiltonian system when subject to perturbation. In terms of the action–angle variables (J, θ) of the integrable system, the Hamiltonian for the perturbed system in the case of one degree-of-freedom can be written as

$$H = H_0(J) + H_1(J, \theta, t), \quad (1)$$

where H_0 is the Hamiltonian of the integrable system and the perturbation is represented by H_1 . Since the pioneering work of Poincaré, it has been known that the dynamics for Hamiltonians of this form is far from trivial. Typically, the phase space consists of a complicated mixture of integrable (confined to invariant tori) and nonintegrable (chaotic) trajectories. Thus, the problem of the transition to chaos is to determine which trajectories of H_0 remain integrable and which become chaotic under the effect of H_1 .

Renormalization In Areapreserving Maps:

Renormalisation in Area-preserving Maps R. S. MacKay, 1993 This book is adapted and revised from the author's seminal PhD thesis in which two forms of asymptotically universal structure were presented and explained for area preserving maps Area preserving maps are the discrete time analogue of two degree of freedom Hamiltonian systems How they work and much of their dynamics are described in this book The asymptotically universal structure is found on small scales in phase space and long time scales The key to understanding it is renormalisation that is looking at a system on successively smaller phase space and longer time scales Having presented this idea the author briefly surveys the use of the idea of renormalisation in physics The renormalisation picture is then presented as the key to understanding the transition from regular to chaotic motion in area preserving maps Although written ten years ago the subject matter continues to interest many today This updated version will be useful to both researchers and students

Topics In Nonlinear Time Series Analysis, With Implications For Eeg Analysis Andreas Galka, 2000-02-18 This book provides a thorough review of a class of powerful algorithms for the numerical analysis of complex time series data which were obtained from dynamical systems These algorithms are based on the concept of state space representations of the underlying dynamics as introduced by nonlinear dynamics In particular current algorithms for state space reconstruction correlation dimension estimation testing for determinism and surrogate data testing are presented

algorithms which have been playing a central role in the investigation of deterministic chaos and related phenomena since 1980 Special emphasis is given to the much disputed issue whether these algorithms can be successfully employed for the analysis of the human electroencephalogram

Positive Transfer Operators and Decay of Correlations Viviane Baladi, 2000 Although individual orbits of chaotic dynamical systems are by definition unpredictable the average behavior of typical trajectories can often be given a precise statistical description Indeed there often exist ergodic invariant measures with special additional features For a given invariant measure and a class of observables the correlation functions tell whether and how fast the system mixes i e forgets its initial conditions This book addressed to mathematicians and mathematical or mathematically inclined physicists shows how the powerful technology of transfer operators imported from statistical physics has been used recently to construct relevant invariant measures and to study the speed of decay of their correlation functions for many chaotic systems Links with dynamical zeta functions are explained The book is intended for graduate students or researchers entering the field and the technical prerequisites have been kept to a minimum

Rayleigh-Bénard Convection Alexander V. Getling, 1998 This invaluable book presents a concise but systematic account of the formation of spatial flow structures in a horizontal fluid layer heated from below Flows of this type known as Rayleigh Bénard convection show important features of behaviour inherent not only in various hydrodynamic instability phenomena but also in nonlinear pattern forming processes in other contexts The book describes the basic methods of investigating convection patterns and the types of two and three dimensional flows pattern defects and sequences of convection regime changes The author pays special attention to the question of how various factors mainly reducible to initial and boundary conditions determine the shapes and sizes of the structures which develop In this way the role of order and disorder in flow patterns as a factor strongly affecting the character of the evolution of structures is revealed The presentation emphasizes the physical picture of these phenomena without excessive mathematical detail

Energy Localisation And Transfer Thierry Dauxois, Anna Litvak-hinenzon, Anna Spanoudaki, Robert S Mackay, 2004-02-09 This book provides an introduction to localised excitations in spatially discrete systems from the experimental numerical and mathematical points of view Also known as discrete breathers nonlinear lattice excitations and intrinsic localised modes these are spatially localised time periodic motions in networks of dynamical units Examples of such networks are molecular crystals biomolecules and arrays of Josephson superconducting junctions The book also addresses the formation of discrete breathers and their potential role in energy transfer in such systems

Time Reversibility, Computer Simulation, and Chaos William Graham Hoover, 1999 A small army of physicists chemists mathematicians and engineers has joined forces to attack a classic problem the reversibility paradox with modern tools This book describes their work from

the perspective of computer simulation emphasizing the author's approach to the problem of understanding the compatibility and even inevitability of the irreversible second law of thermodynamics with an underlying time reversible mechanics. Computer simulation has made it possible to probe reversibility from a variety of directions and chaos theory or nonlinear dynamics has supplied a useful vocabulary and set of concepts which allow a fuller explanation of irreversibility than that available to Boltzmann or to Green and Kubo and Onsager. Clear illustration of concepts is emphasized throughout and reinforced with a glossary of technical terms from the specialized fields which have been combined here to focus on a common theme. The book begins with a discussion contrasting the idealized reversibility of basic physics and the pragmatic irreversibility of real life. Computer models and simulation are next discussed and illustrated. Simulations provide the means to assimilate concepts through worked out examples. State of the art analyses from the point of view of dynamical systems are applied to many body examples from nonequilibrium molecular dynamics and to chaotic irreversible flows from finite difference finite element and particle based continuum simulations. Two necessary concepts from dynamical systems theory, fractals and Lyapunov instability, are fundamental to the approach. Undergraduate level physics, calculus and ordinary differential equations are sufficient background for a full appreciation of this book which is intended for advanced undergraduates, graduates and research workers. The generous assortment of examples worked out in the text will stimulate readers to explore the rich and fruitful field of study which links fundamental reversible laws of physics to the irreversibility surrounding us all.

Microscopic Chaos, Fractals and Transport in Nonequilibrium Statistical Mechanics Rainer Klages, 2007. A valuable introduction for newcomers as well as an important reference and source of inspiration for established researchers, this book provides an up to date summary of central topics in the field of nonequilibrium statistical mechanics and dynamical systems theory. Understanding macroscopic properties of matter starting from microscopic chaos in the equations of motion of single atoms or molecules is a key problem in nonequilibrium statistical mechanics. Of particular interest both for theory and applications are transport processes such as diffusion, reaction, conduction and viscosity. Recent advances towards a deterministic theory of nonequilibrium statistical physics are summarized. Both Hamiltonian dynamical systems under nonequilibrium boundary conditions and non-Hamiltonian modelings of nonequilibrium steady states by using thermal reservoirs are considered. The surprising new results include transport coefficients that are fractal functions of control parameters, fundamental relations between transport coefficients and chaos quantities and an understanding of nonequilibrium entropy production in terms of fractal measures and attractors. The theory is particularly useful for the description of many particle systems with properties in between conventional thermodynamics and nonlinear science as they are frequently encountered on nanoscales.

Smooth Particle Applied Mechanics: The State Of The Art William Graham Hoover, 2006-11-02. This book takes readers through all the steps necessary for solving hard problems in continuum mechanics with smooth particle methods. Pedagogical problems clarify the generation of initial conditions, the treatment of

boundary conditions the integration of the equations of motion and the analysis of the results Particular attention is paid to the parallel computing necessary for large problems and to the graphic displays including debugging software required for the efficient completion of computational projects The book is self contained with summaries of classical particle mechanics and continuum mechanics for both fluids and solids computer languages the stability of numerical methods Lyapunov spectra and message passing parallel computing The main difficulties faced by meshless particle methods are discussed and the means of overcoming them are illustrated with worked examples

Methods In Equivariant Bifurcations And Dynamical Systems Pascal Chossat,Reiner Lauterbach,2000-02-28 This invaluable book presents a comprehensive introduction to bifurcation theory in the presence of symmetry an applied mathematical topic which has developed considerably over the past twenty years and has been very successful in analysing and predicting pattern formation and other critical phenomena in most areas of science where nonlinear models are involved like fluid flow instabilities chemical waves elasticity and population dynamics The book has two aims One is to expound the mathematical methods of equivariant bifurcation theory Beyond the classical bifurcation tools such as center manifold and normal form reductions the presence of symmetry requires the introduction of the algebraic and geometric formalism of Lie group theory and transformation group methods For the first time all these methods in equivariant bifurcations are presented in a coherent and self consistent way in a book The other aim is to present the most recent ideas and results in this theory in relation to applications This includes bifurcations of relative equilibria and relative periodic orbits for compact and noncompact group actions heteroclinic cycles and forced symmetry breaking perturbations Although not all recent contributions could be included and a choice had to be made a rather complete description of these new developments is provided At the end of every chapter exercises are offered to the reader
