

The term "psychobiology" has been used in a variety of contexts, but was likely first used in its modern sense by Knight Dunlap in his book, *An Outline of Psychobiology* (1914).^[10] Although a "forgotten man" of American psychology, Dunlap also founded the journal *Psychobiology*. In the announcement of that journal, Dunlap writes that the journal will publish research "...bearing on the interconnection of mental and physiological functions," which describes the field of biological psychology even in its modern sense.^[11]

Contemporary biopsychology links psychology and biology

For many decades, biopsychology or psychobiology has been a site of exchange of concepts, information, and techniques between psychology and the biological sciences. In many cases, humans may serve as experimental subjects in biological psychology experiments; however, a great deal of the experimental literature in biological psychology comes from the study of non-human species, most frequently rats, mice, and monkeys. As a result, a critical assumption in biological psychology is that organisms share biological and behavioral similarities, enough to permit extrapolations across species. This allies biological psychology closely with comparative psychology, evolutionary psychology, and evolutionary biology. Biological psychology also has paradigmatic and methodological similarities to neuropsychology, which relies heavily on the study of the behavior of humans with nervous system dysfunction (a non-experimentally based biological manipulation).

A psychobiologist or biopsychologist may compare the imprinting behavior in goslings to the early attachment behavior in human infants and construct theory around these two phenomena. Biological psychologists may often be interested in measuring some biological variable, such as an anatomical, physiological, or genetic variable, in an attempt to relate it quantitatively or qualitatively to a psychological or behavioral variable, and thus, contribute to evidence based practice.

Unlike other subdivisions within biological psychology, the main focus of physiological psychological research is the development of theories that explain brain-behavior relationships rather than the development of research that has translational value. It is sometimes alternatively called "psychophysiology," and in recent years also "cognitive neuroscience." One example of physiological psychology research is the study of the role of the hippocampus in learning and memory. This can be achieved by surgical removal of the hippocampus from the rat brain followed by an assessment of memory tasks by that same rat.^[12]
