**Broadening the Dementia Debate** Ruth Bartlett, Deborah O'Connor, 2010 This book examines dementia from a social citizenship perspective. It looks at rights, status, and participation and shows how this framework can be applied in practice.

**Research and Practice in Alzheimer's Disease - Volume 5**, 2001

***Dementia and Human Rights*** Suzanne Cahill, 2018-03-28 The time has come to further challenge biomedical and clinical thinking about dementia, which has for so long underpinned policy and practice. Framing dementia as a disability, this book takes a rights-based approach to expand the debate. Applying a social constructionist lens, it builds on earlier critical perspectives by bringing together concepts including disability, social inclusion, personhood, equality, participation, dignity, empowerment, autonomy, and solidarity. Launching the debate into new and exciting territory, the book argues that people living with dementia come within the UN Convention on the Rights of Persons with Disabilities and therefore have full entitlement to all the rights the Convention enshrines. A human rights-based approach has not to date been fully applied to interrogate the lived experience and policy response to dementia. With the fresh analytical tools provided in this book, policy makers and practitioners will gain new insights into how this broader perspective can be used to further promote the quality of life and quality of care for all those affected by dementia.

**Ageing and Dementia** Kurt Jellinger, Reinhold Schmidt, Manfred Windisch, 2002-08-20 Epidemiological studies, modern clinical neuroimaging, neuropsychological, molecular biological, and genetic studies have considerably enhanced our knowledge about ageing processes of the human brain, its sequelae, diagnostic and therapeutic possibilities, and limits. In addition to Alzheimer's disease and other degenerative dementias, the impact of cerebrovascular lesions and their risk factors in the pathogenesis of cognitive disorders of the aged

are increasingly acknowledged and the recognition of mild cognitive impairment as a frequent initial stage of developing dementia is becoming an increasingly important diagnostic and therapeutic problem The included papers were presented at the 7th International Symposium in Graz Sept 2001 and give a timely overview of the current and future concepts of pathogenesis diagnosis and treatment strategies of pathological brain ageing and dementias early recognition of mild cognitive impairment and future possibilities of prevention of dementing processes

*Preclinical and clinical issues in Alzheimer's disease drug research and development* Cesare Mancuso, Silvana Gaetani, 2015-03-03 Alzheimer's disease AD is a chronic neurodegenerative disorder characterized by progressive cognitive dysfunction and memory loss inability to perform the activities of daily living and mood disorders According to the so called amyloid cascade hypothesis amyloid peptide A produced by beta and gamma secretase mediated cleavages of the amyloid precursor protein APP plays a pivotal role in the pathogenesis of AD A was also shown to contribute to AD pathology by stimulating the hyperphosphorylation of tau which is responsible for the formation of neurofibrillary tangles However the amyloid cascade hypothesis was challenged by other theories which lend support to the idea that A is not causative but can be considered as an innocent bystander in AD Although preclinical research generated impressive lines of evidence about the several intracellular mechanisms whose impairment leads to the onset and progression of AD clinical research aimed at the

development of new drugs capable of preventing or delaying the onset of neuronal damage in AD patients has produced limited results. The drugs currently available for the treatment of AD are acetylcholinesterase inhibitors (AChEI) and the NMDA glutamate receptor antagonist memantine. The AChEI increase acetylcholine levels in the synaptic cleft which are reduced because of the progressive damage of cholinergic neurons in cognitive brain areas e.g. amygdala, hippocampus and frontal cortex, whereas memantine is used to prevent/reduce calcium dependent excitotoxic neuronal cell death. Both classes of drugs have been shown to improve symptoms related to cognitive decline but their effects are confined largely to patients with mild to moderate AD in particular during the first year or so of treatment. An alternative to this symptomatic treatment involves the use of drugs that intervene in the pathogenesis of the disease. Recently monoclonal antibodies against A were proposed as novel agents capable to remove A from the brain thus preventing neuronal damage. The research topic focuses on the preclinical and clinical evidence about the several factors that contribute to the pathogenesis of AD as well as the potential therapeutic role of new classes of drugs still under preclinical or clinical development.
