Rubia And Its Banking System:

Systemic Risk and Asymmetric Responses in the Financial Industry Mr. Germán López-Espinosa, Mr. Antonio Rubia, Ms. Laura Valderrama, Mr. Antonio Moreno, 2012-06-01 To date an operational measure of systemic risk capturing non linear tail comovement between system wide and individual bank returns has not yet been developed This paper proposes an extension of the so called CoVaR measure that captures the asymmetric response of the banking system to positive and negative shocks to the market valued balance sheets of individual banks For the median of our sample of U S banks the relative impact on the system of a fall in individual market value is sevenfold that of an increase Moreover the downward bias in systemic risk from ignoring this asymmetric pattern increases with bank size The conditional tail comovement between the banking system and a top decile bank which is losing market value is 5.4 larger than the unconditional tail comovement versus only 2.2 for banks in the bottom decile The asymmetric model also produces much better estimates and fitting and thus improves the capacity to monitor systemic risk Our results suggest that ignoring asymmetries in tail interdependence may lead to a severe underestimation of systemic risk in a downward market

Connectedness and Contagion Hal S. Scott, 2016-05-13 An argument that contagion is the most significant risk facing the financial system and that Dodd Frank has reduced the government's ability to respond effectively The Dodd Frank Act of 2010 was intended to reform financial policies in order to prevent another massive crisis such as the financial meltdown of 2008 Dodd Frank is largely premised on the diagnosis that connectedness was the major problem in that crisis that is that financial institutions were overexposed to one another resulting in a possible chain reaction of failures In this book Hal Scott argues that it is not connectedness but contagion that is the most significant element of systemic risk facing the financial system Contagion is an indiscriminate run by short term creditors of financial institutions that can render otherwise solvent institutions insolvent It poses a serious risk because as Scott explains our financial system still depends on approximately 7.4 to 8.2 trillion of runnable and uninsured short term liabilities 60 percent of which are held by nonbanks Scott argues that efforts by the Federal Reserve the FDIC and the Treasury to stop the contagion that exploded after the bankruptcy of Lehman Brothers lessened the economic damage And yet Congress spurred by the public's aversion to bailouts has dramatically weakened the power of the government to respond to contagion including limitations on the Fed's powers as a lender of last resort Offering uniquely detailed forensic analyses of the Lehman Brothers and AIG failures and suggesting alternative regulatory approaches Scott makes the case that we need to restore and strengthen our weapons for fighting contagion

The Great Cross-Border Bank Deleveraging Mr. Eugenio Cerutti, Mr. Stijn Claessens, 2014-09-25 International banks greatly reduced their direct cross border and local affiliates lending as the global financial crisis strained balance sheets lowered borrower demand and changed government policies Using bilateral lender borrower country data and controlling for credit demand we show that reductions largely varied in line with markets prior assessments of banks vulnerabilities with banks financial statement variables and lender borrower country characteristics playing minor roles We find evidence that moving resources within banking groups became more restricted as drivers of reductions in direct cross border loans differ from those for local affiliates lending especially for impaired banking systems Home bias induced by government interventions however affected both equally

Belgium International Monetary Fund. Monetary and Capital Markets Department, 2018-03-08 This Technical Note discusses the results of the stress testing of Belgium's banking and insurance sectors Belgium's financial sector remains resilient in the face of the rising cyclical vulnerabilities but there is a need for closely monitoring risks Stress tests on banks and insurance companies confirm that they can absorb credit sovereign and market losses in the event of a severe deterioration in macro financial conditions All banks meet minimum capital requirements and none needs to draw down its capital conservation buffer over the stress horizon The risk of interbank contagion through direct exposures is low Insurance companies are also generally resilient and losses incurred in the stress scenarios by those that belong to banking groups do not threaten the soundness of those groups
