Protecting and maintaining water distribution systems is crucial to ensuring high quality drinking water. Distribution systems consisting of pipes, pumps, valves, storage tanks, reservoirs, meters, fittings, and other hydraulic appurtenances carry drinking water from a centralized treatment plant or well supplies to consumers' taps. Spanning almost 1 million miles in the United States, distribution systems represent the vast majority of physical infrastructure for water supplies and thus constitute the primary management challenge from both an operational and public health standpoint. Recent data on waterborne disease outbreaks suggest that distribution systems remain a source of contamination that has yet to be fully addressed. This report evaluates approaches for risk characterization and recent data and it identifies a variety of strategies that could be considered to reduce the risks posed by water quality deteriorating events in distribution systems. Particular attention is given to backflow events via cross connections, the potential for contamination of the distribution system during construction and repair activities, maintenance of storage facilities, and the role of premise plumbing in public health risk. The report also identifies advances in detection, monitoring, and modeling, analytical methods, and research and development opportunities that will enable the water supply industry to further reduce risks associated with drinking water distribution systems.

Predictive Models for Water Quality in Distribution Systems J. Clement, 2005-04-30 There are two groups of specialists involved in the development and application of water quality models, each of which have a different perspective on the use of models: Academics and scientists (chemistry specialists and microbiologists who develop the models) and Practitioners (modelers and distribution engineers who use them to solve problems). There are limitations and constraints in the characterization of the underlying processes and the practical application of models to distribution networks which require further research. The objectives of the research were to characterize the current state of predictive distribution system water quality models and to identify critical research needs for their improvement. The project reviewed both the development and application of models. The report is intended to both steer future research and to act as a general reference on water quality modeling. The report combines a literature review with the practical experience of the project team. The content of a draft report was discussed at an international workshop attended by academics, engineers, scientists, and hydraulic modelers with the objective of agreeing on specific research needs necessary to improve predictive modeling for water quality in distribution systems. The conclusions of the report are derived from the workshop and form the basis of 11 specific research briefs that have been submitted to AwwaRF for consideration of

funding Researchers often focus on modeling the individual processes that control water quality rather than fully modeling water quality throughout distribution systems For these process models to be applied to real distribution networks they need to be extended to take in account the physical characteristics of the system the special and temporal variations in flow velocity and water age and the effects of mixing water that has traveled along different flow paths Guidance Manual for Monitoring Distribution System Water Quality Gregory J. Kirmeyer,AWWA Research Foundation,2002 Provides guidelines for developing a water quality monitoring program specific to the distribution system of a water utility The report identifies monitoring objectives addresses common program design issues and develops protocols for monitoring programs Topics include nitrification booster chl

Public Water Supply Distribution Systems National Research Council,Division on Earth and Life Studies,Water Science and Technology Board,Committee on Public Water Supply Distribution Systems: Assessing and Reducing Risks,2005-04-12 The Water Science and Technology Board has released the first report of the Committee on Public Water Supply Distribution Systems Assessing and Reducing Risks which is studying water quality issues associated with public water supply distribution systems and their potential risks to consumers The distribution system which is a critical component of every drinking water utility constitutes a significant management challenge from both an operational and public health standpoint This first report was requested by the EPA as the agency considers revisions to the Total Coliform Rule with potential new requirements for ensuring the integrity of the distribution system This first report identifies trends relevant to the deterioration of drinking water quality in distribution systems and prioritizes issues of greatest concern according to high medium and low priority categories Of the issues presented in nine EPA white papers that were reviewed by the committee cross connections and backflow new or repaired water mains and finished water storage facilities were judged by the committee to be of the highest importance based on their associated potential health risks In addition the report noted that two other issues should also be accorded high priority premise plumbing and distribution system operator training This first report will be followed in about 18 months by a more comprehensive final report that evaluates approaches for risk characterization and identifies strategies that could be considered to reduce the risks posed by water quality deteriorating events

Kirmeyer,2001 Reports on a project that identifies pathogen routes of entry into water distribution systems and develops monitoring and control strategies for protecting the system Contains chapters on pathogens and pathways existing control strategies transient surge modeling pressure monitoring field monitoring recommended control strategies and recommendations to utilities The project was completed by a multi disciplinary team of engineers and practitioners with funding from the American Water Works Association Research Foundation and the Environmental Protection Agency The book is not indexed Annotation c Book News Inc Portland OR booknews com

Water Quality in Drinking Water Distribution Systems Mirjam Blokker,Joost Van Summeren,Vanessa Speight,2020-12-02 Safe drinking water is paramount for the health and

wellbeing of all human populations Water is extracted from surface and groundwater sources and treated to comply with drinking water standards The water is then circulated through the drinking water distribution system DWDS Within the DWDS water quality can deteriorate due to microbiological growth chemical reactions interactions with ageing and deteriorating infrastructure and through maintenance and repair activities Some DWDS actions may serve to improve water quality however these can adversely impact the drinking water system and cause instances of poor water quality or disease outbreaks We invited papers covering examinations of DWDS design and operational practices and their impact on water quality We received papers based on practical research in real DWDS and laboratory test facilities We also received papers on novel modelling approaches A wide range of water quality aspects was gathered including temperature disinfection bacterial communities and biofilm fecal contamination and QMRA and the effects of flushing and intermittent supply
