Novel Aspects of Nucleolar Functions in Plant Growth and Development Munetaka Sugiyama,Yasunori Machida,2018 The nucleolus is a prominent nuclear domain that is common to eukaryotes Since the nucleolus was first described in the 1830s its identity had remained a mystery for longer than 100 years Major advances in understanding of the nucleolus were achieved through electron microscopic and biochemical studies in the 1960s to 1970s followed by molecular biological studies These studies finally established the view of the nucleolus that it is a large aggregate of RNA protein complexes associated with the rRNA gene region of chromosome DNA serving mainly as a site of ribosome biogenesis where pre rRNA transcription pre rRNA processing and ribosome assembly occur This function of the nucleolus appears to indicate that the nucleolus plays a constitutive and essential role in fundamental cellular activities by producing ribosomes Recent research has shown however that the nucleolus is more dynamic and can have more specific and wider functions In plants nucleolar functions have been implicated in developmental regulations and environmental responses by accumulating pieces of evidence obtained mostly from genetic studies of nucleolar factor related mutants Comprehensive analysis of nucleolar proteins and molecular cytological characterization of sub nucleolar and peri nucleolar bodies have also provided new insights into behaviors and functions of the plant nucleolus In this Research Topic we would like to collect physiological and molecular links between the nucleolus to plant growth and development shed light on novel aspects of nucleolar functions beyond its classical view and stimulate research activities focusing on the nucleolus across various fields of plant science including molecular biology cell biology genetics developmental biology physiology and evolutionary biology

Virtual Plants: Modeling Plant Architecture in Changing Environments Katrin Kahlen, Hartmut Stützel, 2017-02-07 Plant architecture is a major determinant of the resource use efficiency of crops The architecture of a plant shows ontogenetic structural changes which are modified by multiple environmental factors Plant canopies are exposed to natural fluctuations in light quantity and the dynamically changing canopy architecture induces local variations in light quality Changing temperature conditions or water availability during growth additionally affect plant architecture and thus crop productivity because plants have various options to adapt their architecture to the available resources Meeting the challenge of ensuring food security we must understand the plant s mechanisms for integrating and responding to an orchestra of environmental factors Virtual plants describe plant architecture in silico Virtual plants have the potential to help us understanding the complex feedback processes between canopy architecture multiple environmental factors and crop productivity As a research tool they have become increasingly popular within the last decade due to their great power of realistically visualizing the plant s architecture This Research Topic highlights current research carried out on modeling plant architecture in changing environments

Recent Advances in the Modeling of Hydrologic Systems D.S Bowles, P. Enda O'Connell, 2012-12-06 Modeling of the rainfall runoff process is of both scientific and practical significance Many of the currently used mathematical models of hydrologic systems were developed a generation ago Much of the effort since then has focused on refining these models rather than on developing new models based on improved scientific understanding In the past few years however a renewed effort has been made to improve both our fundamental understanding of hydrologic processes and to exploit technological advances in computing and remote sensing It is against this background that the NATO Advanced Study Institute on Recent Advances in the Modeling of Hydrologic Systems was organized The idea for holding a NATO ASI on this topic grew out of an informal discussion between one of the co directors and Professor Francisco Nunes Correia at a

Workshop on Modeling Wheat Response to High Temperature; El Batan, Texcoco, Mexico; 19-21 Jun 2013 Alderman, P.D., Quilligan, E., Asseng, S., Ewert, F., Reynolds, M.P., 2014-01-20 **"Bridging Boundaries: Multidisciplinary Research in Science, Commerce and Humanities"** Prof. (Dr.) M. K. Patil, 2024-04-21 Ray Bradbury's Fahrenheit 451 depicts a dystopian society where technology particularly in the form of mass media and censorship plays a central role in controlling and manipulating the populace. However, the novel also explores the paradoxical relationship between technology and human connection, highlighting both its potential for liberation and its capacity for oppression. This research paper aims to analyze the multifaceted portrayal of technology in Fahrenheit 451, examining its role in fostering isolation and conformity while also exploring its subversive potential as a tool for resistance and introspection. Through a close reading of the novel's themes, characters, and narrative structure, this paper elucidates Bradbury's nuanced commentary on the complex interplay between technology, knowledge, and freedom.

Wheat Growth and Modelling W. Day, R.K. Atkin, 2013-10-07 The concept of using mathematical models to investigate crop growth and productivity has attracted much attention in recent years. A major reason is that modelling can allow an expert in one area to assess the impact of his ideas in the light of other advances in our understanding of crop performance. Whether or not many of the claims made for or the demands made of models can ever be satisfied, this role as a focus for quantitative definition of crop growth is an important one. One consequence is that the development and appraisal of such models requires the efforts of scientists from a wide range of disciplines. This NATO Advanced Research workshop was designed to bring together such a range of scientists to consider the wheat crop and assess our understanding of the crop and our ability to model its growth and yield. The ideas and organization behind the workshop involved many people. The U.K. interest in a computer model of wheat growth was instigated by Dr Joe Landsberg then of Long Ashton Research Station but now Director of CSIRO Division of Forest Research who in 1979 started a modelling exercise as part of a collaborative study of the causes of yield variation in winter wheat involving four research institutes supported by the Agricultural and Food Research Council.
