*Models for Public Systems Analysis* Edward J. Beltrami, 2013-09-17 *Models for Public Systems Analysis* considers the mathematical model formulation to improve the delivery of urban service systems such as sanitation fire police and ambulances This book is composed of five chapters that demonstrate the translation of significant societal problems into a mathematical framework as well as the advantages and limitations of these models Chapter 1 deals with the issue of plant location and siting questions with a brief overview of water resource modeling while Chapter 2 provides set covering models for manpower scheduling as a direct outgrowth of the author's experience with the Sanitation Department in New York City Chapters 3 and 4 describe the delivery of emergency services particularly with models of congestion and delay and of optimal deployment These chapters also present probabilistic analysis in nature since both the spatial and the temporal patterns of demand are intrinsically uncertain The tools used are queueing theory and geometric probability Chapter 5 examines network optimization methods mainly to explore questions of vehicle routing and scheduling This chapter also provides a few comments on large scale models of urban growth these being generally more familiar to the regional planner than to the operations analyst This book will prove useful to applied mathematics and policy science students

**Computer Methods in Operations Research** Arne Thesen, 2014-05-10 *Computer Methods in Operations Research* focuses on the computational methods used in operations research Topics covered range from list processing to sorting and searching networks and critical path methods Resource constrained scheduling methods and linear programming methods are also discussed along with the branch and bound concept Comprised of 11 chapters this book begins with a review of some of the basic principles that make a software development effort successful emphasizing the need to keep things simple and understandable The reader is then introduced to the basic principles of list processing searching and sorting the concept of networks and several matrix and list oriented methods for representing networks in the computer and the critical path method Subsequent chapters deal with more complex programs and algorithms to handle scheduling of activities under precedence and resource restrictions the resource constrained scheduling problem formulated both in an exact using integer programming and in a heuristic manner the design of algorithms for the solution of large linear programming problems and the application of list processing concepts to the development of branch and bound algorithms for solution of combinatorial optimization problems The book also considers the design of random number generators and discrete event simulation programming before concluding with a description of two programming languages GPSS and WIDES for use in simulation modeling This monograph will be of value to students and practitioners of operations research and industrial engineering
