Models Of Massive Parallelism:

Models of Massive Parallelism Max Garzon, 2012-12-06 Locality is a fundamental restriction in nature. On the other hand, adaptive complex systems, life in particular, exhibit a sense of permanence and timelessness amidst relentless constant changes in surrounding environments that make the global properties of the physical world the most important problems in understanding their nature and structure. Thus, much of the differential and integral Calculus deals with the problem of passing from local information as expressed for example by a differential equation or the contour of a region to global features of a system's behavior: an equation of growth or an area. Fundamental laws in the exact sciences seek to express the observable global behavior of physical objects through equations about local interaction of their components on the assumption that the continuum is the most accurate model of physical reality. Paradoxically, much of modern physics calls for a fundamental discrete component in our understanding of the physical world. Useful computational models must be eventually constructed in hardware and as such can only be based on local interaction of simple processing elements.

Models of Massive Parallelism Max Garzon, 1995-06-20 This textbook provides an introduction to the fundamental models of massively parallel computation, the most important technique for high performance computing. It presents a coherent exposition of analytic methods and results for the exploration and understanding of cellular automata and discrete neural networks as computational and dynamical systems. The book will be useful also as a reference manual to the scattered literature in the field. Each chapter includes a separate bibliography as well as pointers to historically relevant papers and gives exercise problems for the reader.

Models for Parallel and Distributed Computation R. Correa, Ines de Castro Dutra, Mario Fiallos, Luiz Fernando Gomes da Silva, 2013-06-29 Parallel and distributed computation has been gaining a great lot of attention in the last decades. During this period, the advances attained

in computing and communication technologies and the reduction in the costs of those technologies played a central role in the rapid growth of the interest in the use of parallel and distributed computation in a number of areas of engineering and sciences. Many actual applications have been successfully implemented in various platforms varying from pure shared memory to totally distributed models passing through hybrid approaches such as distributed shared memory architectures. Parallel and distributed computation differs from classical sequential computation in some of the following major aspects: the number of processing units, independent local clock for each unit, the number of memory units, and the programming model. For representing this diversity and depending on what level we are looking at the problem, researchers have proposed some models to abstract the main characteristics or parameters: physical components or logical mechanisms of parallel computers. The problem of establishing a suitable model is to find a reasonable trade-off among simplicity, power of expression, and universality. Then be able to study and analyze more precisely the behavior of parallel applications.
